How to use this course:

For younger students (2nd-5th grade) we recommend a "get the basics" approach that focuses on the Mon/Wed classes. For older or more advanced students (6th-8th grade) we recommend completing each of the Friday activities and assignments to reinforce the concepts covered.

Option One: Get the Basics

Ideal for younger students

Participate in Mon-Wed classes only. Friday activities, articles, and other assignments are optional. They can be skipped, saved for later, or completed depending on your preference.

Tips for best learning:

- Read the pages that go with each lesson before watching the video. Take 10-15 minutes before class to see if you can fill in the blanks. If you can't fill in everything, that's okay! Listen during class to see if you can complete the page.
- If a lesson moved too fast, rewatch it later to help learn the concepts.
- Download the answer key for the notes, but don't look at the answers until after you give things a try yourself!

Option Two: The Full Course

ldeal for older students & advanced learners

Participate in Mon-Wed classes and do the Friday activities and reading assignments.

Complete all quizzes and assignments to receive a certificate of completion at the end of the course.

Project Supply List:

Lesson 3 - Vegetative Propagation with Potato

- Potato or sweet potato (for quicker results, use one where the eyes have already begun to sprout)
- Knife
- 4 large pots or burlap sacks
- Potting soil

Lesson 18 - Gummy Worm Karyotypes

- Enough gummy worms or other oblong-shaped colorful candy to create 16 pairs of chromosomes
- Chocolate (to melt and cover some of the gummy worms,)
- Knife or scissors

Lesson 21 - What's the Blood Type?

Home blood typing kit (optional)

Lesson 24 - Apple Variety Taste Test

- Several varieties of apple including Red Delicious, Granny Smith, and three other types.
- Knife

Lesson 30 - Journey of HMS Beagle

- Printable world map
- Paper and scissors
- Crayons, colored pencils, or markers

Lesson 36 - Model a Gene in a Population

20 black marbles and 20 white marbles or ANY other items that can be drawn randomly in a sample! For example, beans, candy, coins, or dice marked with tape.

Lesson 42 - Build your own phylogeny

Paper and art supplies

Lesson 45 - History of Earth Timeline

Paper, tape, and crayons, markers, or colored pencils

Which science standards are covered in this course?

The standards listed below are the national science standards for K-12 education in the United States. They are commonly referred to as Next Generation Science Standards or NGSS.

MS-LS1-4. Use argument based on empirical evidence and scientific reasoning to support an explanation for how characteristic animal behaviors and specialized plant structures affect the probability of successful reproduction of animals and plants respectively. **Lessons 28, 29, 31, 32**

MS-LS1-5. Construct a scientific explanation based on evidence for how environmental and genetic factors influence the growth of organisms. **Lesson 23**

MS-LS3-1. Develop and use a model to describe why structural changes to genes (mutations) located on chromosomes may affect proteins and may result in harmful, beneficial, or neutral effects to the structure and function of the organism. **Lessons 13, 14, 17, 19, 22, 28**

MS-LS3-2. Develop and use a model to describe why asexual reproduction results in offspring with identical genetic information and sexual reproduction results in offspring with genetic variation. **Lessons 2, 4, 5, 7, 10**

MS-LS4-1. Analyze and interpret data for patterns in the fossil record that document the existence, diversity, extinction, and change of life forms throughout the history of life on Earth under the assumption that natural laws operate today as in the past. **Lessons 38, 40, 41, 43**

MS-LS4-2. Apply scientific ideas to construct an explanation for the anatomical similarities and differences among modern organisms and between modern and fossil organisms to infer evolutionary relationships. **Lessons 38, 41**

MS-LS4-3. Analyze displays of pictorial data to compare patterns of similarities in the embryological development across multiple species to identify relationships not evident in the fully formed anatomy. **Lesson 38**

MS-LS4-4. Construct an explanation based on evidence that describes how genetic variations of traits in a population increase some individuals' probability of surviving and reproducing in a specific environment. **Lessons 31, 32, 34**

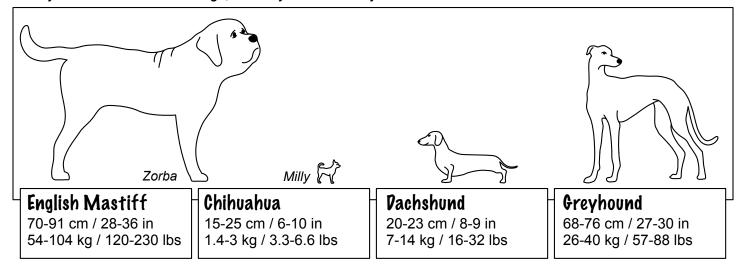

MS-LS4-5. Gather and synthesize information about the technologies that have changed the way humans influence the inheritance of desired traits in organisms. **Lesson 26**

MS-LS4-6. Use mathematical representations to support explanations of how natural selection may lead to increases and decreases of specific traits in populations over time. **Lessons 35, 36**

What makes a species?

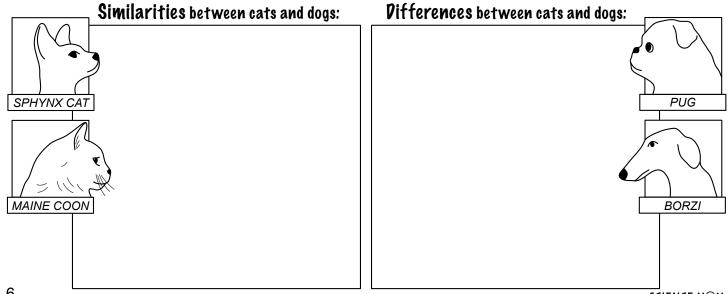

The domestic dog includes hundreds of different breeds with diverse personalities, shapes, and sizes. The biggest dog, an English Mastiff named Zorba, weighed more than 143 kg (315 pounds) and measured 94 cm (37 inches) tall from ground to shoulder. The smallest dog, a Chihuahua named Milly, is just under 10 cm (4 inches) tall and weighs just 0.5 kg (about 1 pound). Mastiffs, Chihuahuas, Dachshunds, and Greyhounds are all called dogs, but they are incredibly different animals!

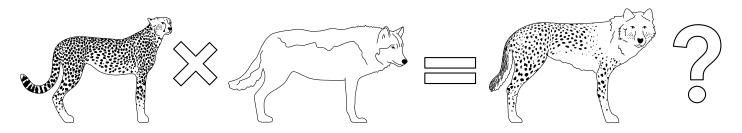

1. What makes a dog a dog? Share your opinion:

2. If the characteristics you described above were used as the official definition of a dog, would cats also be called dogs?

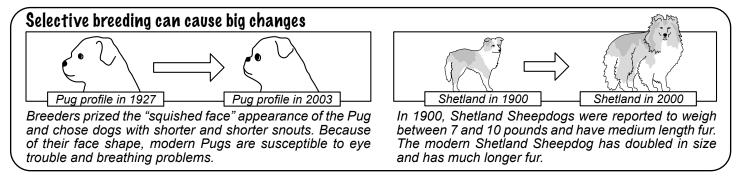

3. List three similarities and differences between cats (Felis) and dogs (Canis):

SCIENCE MMM

4. Coyotes, wolves, and dogs can all interbreed, creating hybrids like the wolfdog, coywolf, coydog or dogote. Lions and tigers can also be bred to create hybrids, which are called ligers or tigons. In your opinion, would it be possible to cross a cheetah with a wolf? If so, what would you call this hybrid? A woltah? A cheef?

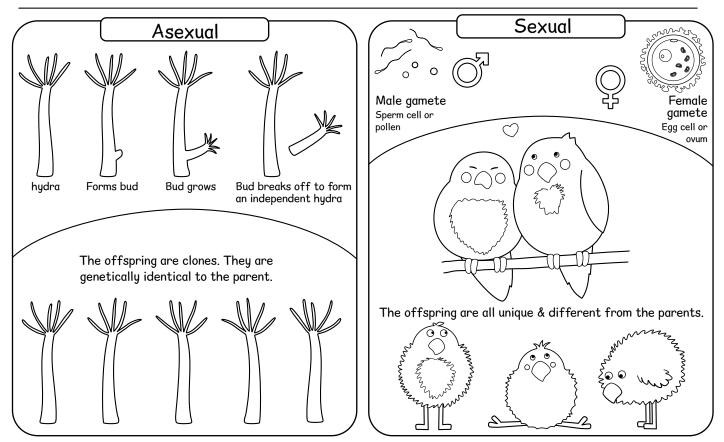

5. Suppose that a settlement on Mars uses Great Danes for pulling sleds while a different settlement uses Chihuahuas for hunting cockroaches that hide in small spaces. If the people in the first settlement selectively breed their Great Danes to be larger and stronger while the people in the second settlement breed their Chihuahuas to be smaller and faster, what would you expect Mars dogs to look like after approximately 1,000 years have passed? Would Great Danes and Chihuahuas be different species from each other then?

<u>Life finds a way</u>

The **ability to reproduce** is one of the key characteristics in most definitions of life. There are two main strategies: asexual reproduction, which creates identical clones, and sexual reproduction which creates offspring that are different from each parent.

Record the primary advantages and disadvantages in each category below. Consider the following:

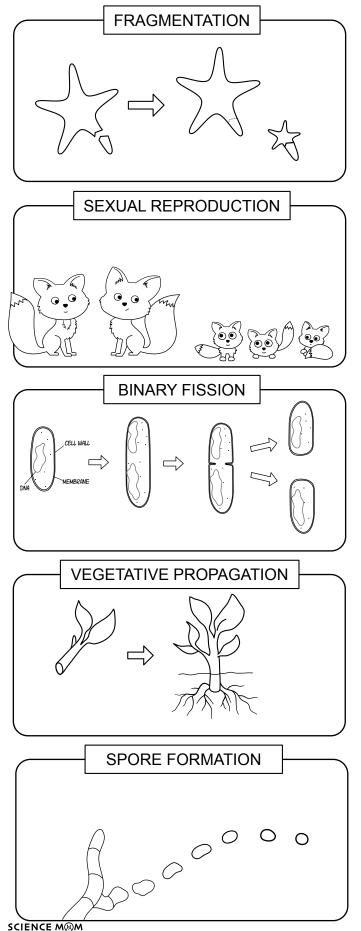

• Speed of reproduction: Is the next generation formed and independently growing within minutes or days? Does it take years to form an independent next generation?

• Genetic diversity: is the diversity high (which provides greater resistance to disease) or low (which makes a population more at risk from disease)?

• Does reproduction require a mate? Could one individual reproduce?

ASE	XUAL RE	PRODUCTION	\vdash	- SEXUAL REF	RODUCTION	$\overline{}$
advantages	3:	disadvantage	es:	advantages:	disadvantages:	:
1						

Match each reproductive strategy with the correct definition:

Genetic information from two individuals is combined to create offspring that are genetically different from both parents. This reproductive strategy is common among animals, fungi, and plants.

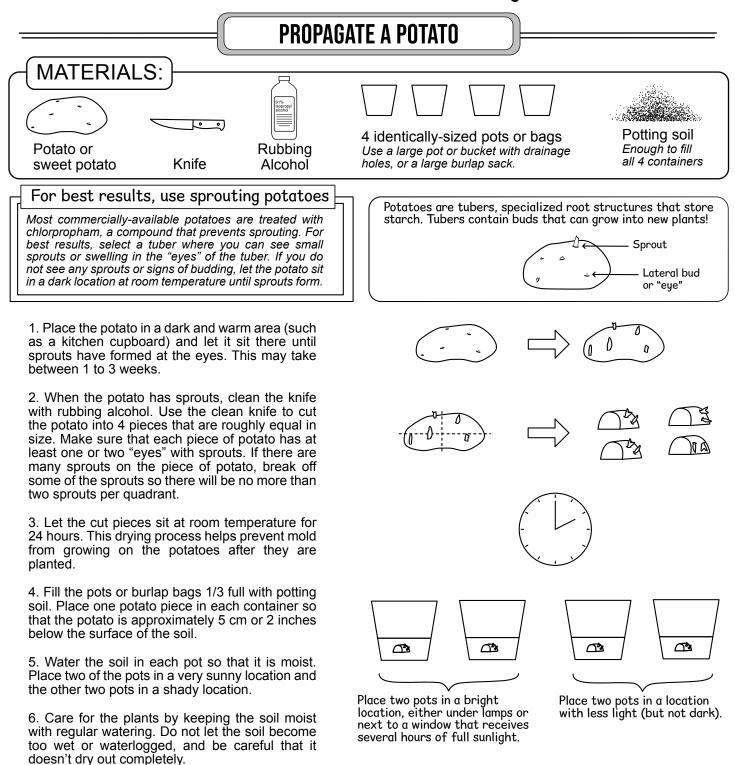

An organism is split into pieces. Each of those fragments then develops into adult individuals that are clones of the original organism. Molds, lichen, sponges, certain worms, and sea stars all use this reproductive strategy.

The division of one cell into two identical cells. This reproductive strategy is used by many types of single-celled life forms including bacteria and archaea.

A specialized cell is formed that can withstand harsh environmental conditions such as drought or extreme heat. Once conditions improve, this cell germinates and begins growing. This reproductive strategy can be either sexual or asexual. Commonly used by fungi.

A form of reproduction occurring in plants where a fragment or cutting is separated from the parent plant and grows as a separate individual. Commonly used with food crops such as bananas, sweet potato, sugarcane, and pineapple.

Hands-on Science Project

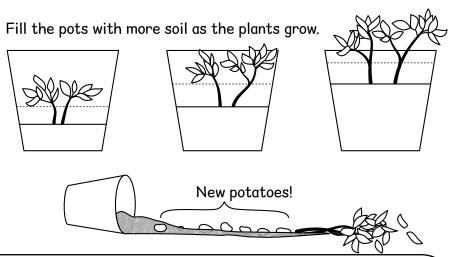

This activity can be done either indoors or outdoors. If you have space and it's winter time, we recommend indoors! If you have cats or dogs, take care that they don't eat the above-ground leaves and stems of the potato plant, which are poisonous. If you would prefer to plant your potatoes outdoors, plant them no earlier than 4 to 6 weeks before the average last frost. They are cold hardy and can handle some freezing or near-freezing temperatures. Whether the plants are indoors or outdoors, they will need at least 10 to 12 weeks of growth to produce a crop of new tubers.

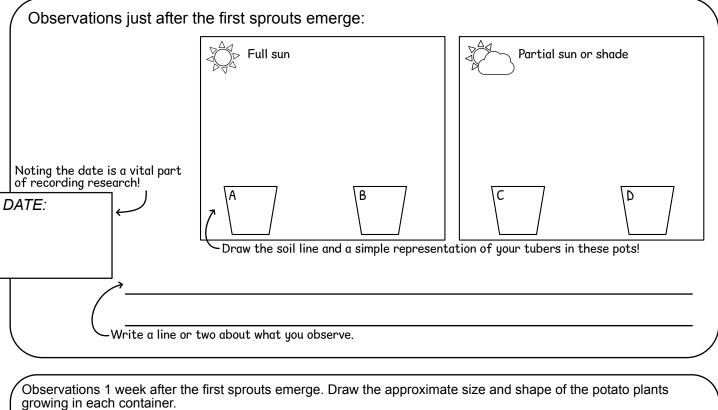

Indoors or Outdoors?

7. After sprouting, continue to add additional layers of potting soil until the pot is full. Record your observations about the size and appearance of the above-ground plants at regular intervals.

8. After 10 to 15 weeks or when the plants begin to die back, pour out the potting soil and sort through it to find the new potato tubers. (See page 13 for more detailed instructions).

How many tubers did you find? Which plants produced the most potatoes?

growing in each container.

When to harvest potatoes

Farmers usually wait until the tops of the potato plants have turned yellow and died back before harvesting. This allows the plant to store the most starch in the tubers.

With potatoes grown indoors, you can wait for the plants to go dormant or you can harvest them anytime after 10-12 weeks of growth. The choice is yours. Harvesting before 10 weeks will result in very small (pea and marble size) potatoes.

How to harvest potatoes

If the plants are in containers, take them outside and empty the dirt from the container. Sift through all the dirt and separate the tubers from the roots and potting soil.

If the plants are in the ground, loosen the soil around them with a shovel. Pull up the plants and then thoroughly explore the area with shovel and hands to be sure you found all of the tubers.

Wash and dry the potatoes and store them in the fridge until ready to eat. If the skin of a new potato is scratched or damaged during harvesting, then they won't store for as long and should be eaten sooner rather than later.

POTATO HARVEST

After harvesting your potatoes, answer the following questions:

1. Which plants produced the greatest number of tubers? Count the record the number of tubers from each plant.

С

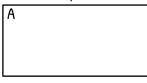

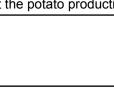

ß

2. Which plant produced the greatest biomass of tubers? In other words, which plant grew the most food? If you don't have a scale to weigh the potatoes, that's okay! Compare the size of the potatoes from each plant and draw pictures to represent the potato production of each.

C

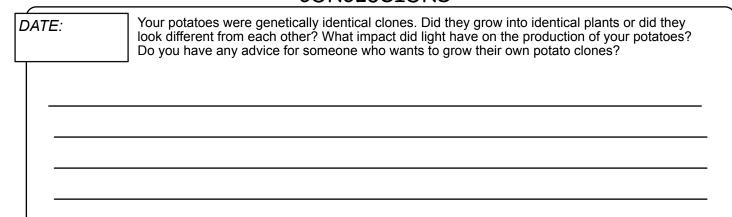

3. The main variable studied in this experiment was light. Ideally, everything else would have been the same for each potato plant. But in real life, experiments don't always have ideal conditions! Were there any other variables that impacted your plants, such as disease, an injury, waterlogged roots, or drought stress?

CONCLUSIONS

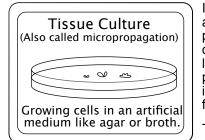

Potato Blight and the Irish Potato Famine

From 1845-1852, Ireland experienced a devastating famine when a fungus-like microorganism called Phytophthora infestans caused a serious disease known as potato blight. The blight caused the Irish to lose about $\frac{3}{4}$ of their most important food crop and resulted in over a million people dying of starvation and millions emigrating away from the island in the following years when the potato harvest was poor. Ireland is possibly the only country in the world that has a lower population today (5 million) than in 1840 (about 6.5 million).

How Potatoes are Grown

Potatoes can be infected by many different pathogens including viral, fungal, bacterial, and protozoan! Because they are susceptible to so many diseases, many of which are hard to detect, the crops of modern potato farmers actually start out in test tubes!

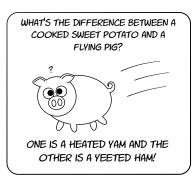

It's called tissue culture and it all begins with a small piece of plant about the size of a flake of pepper. This flake of green leaf tissue is taken from a parent plant which was grown in a controlled environment free from viruses.

The disease-free bit of the plant (meristem) is placed in a

test tube that is has all the nutrients that the plant needs in order to grow. The test tube remains in the sterile lab until the cells have grown into a "plantlet," a small plant with distinct roots, stem, and leaves.

When the plantlets are large enough, they are moved to a greenhouse and planted in the ground. Then, just like regular potatoes, they grow for a few months, forming miniature tubers. After harvesting, these small tubers (called seed potatoes) are sorted and stored until it's time to plant the large crop of potatoes in regular fields.

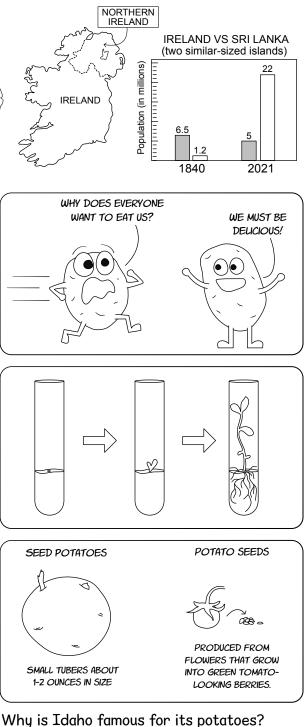

Certified seed potatoes have been tested multiple times to be sure they are free from bacterial, fungal, and viral infections.

When the seed potatoes are ready to be planted, a large machine uses sharp spikes or suction cups to grab each seed potato and drop it into the designated furrow of soil.

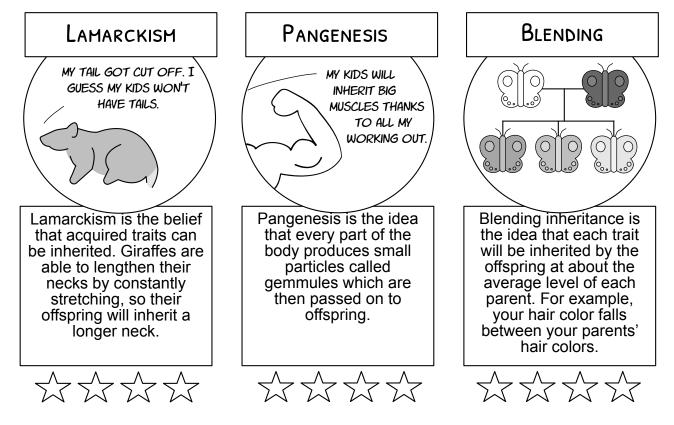

The buds on the seed potatoes sprout into plants and as the plants grow, so does their network of tubers underground. it is now up to the farmer to care for the potatoes by irrigating and fertilizing them. They'll be ready to harvest between 80 to 115 days after planting. At harvest, they're carefully dug up and stored between 10 and 14 days in cool temperatures (\approx 15°C) to allow the skins time to harden and minor injuries to seal. Then they're sent to a grocery store near you!

IDAHO POTATO MUSEUM BLACKFOOT IDAHO

The domestic potato originated in the mountains of Peru. Idaho has a similar climate and geology to this area with warm sunny days, cool nights, and fertile volcanic soil that is well-draining and high in nutrients. The high elevation, geologic history, location, and surrounding areas all combine to make Idaho ideal for potato production. The state grows about 13 billion pounds of potatoes every year.

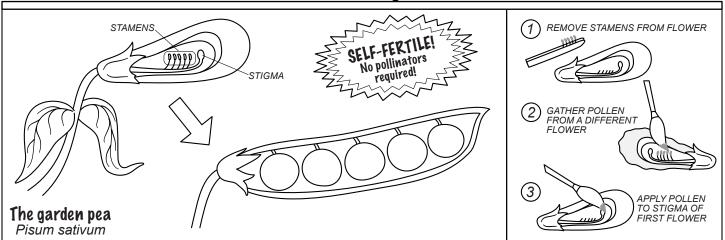

Idaho even has a museum dedicated to the potato with an exhibit of the world's largest potato chip! Throughout history people have had different ideas about how traits are inherited. The three ideas described below were common when Mendel was alive. Which of these ideas best explains what you have observed about traits and how they are inherited? Rate them from one star (not accurate, e.g. there are lots of counter examples for this idea) to four stars (this idea explains inheritance very well).

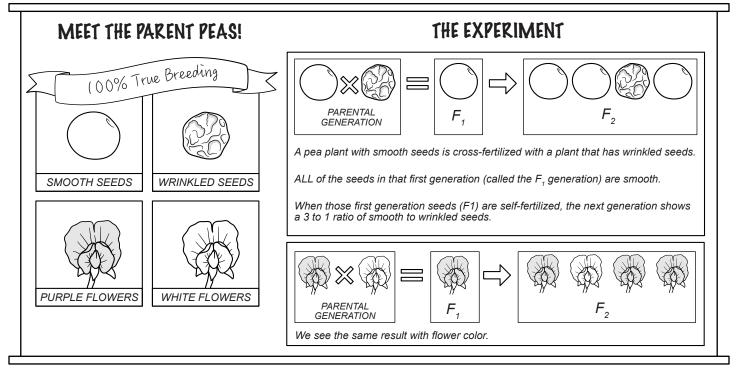

Gregor Mendel

FILL IN THE BLANKS USING THESE WORDS: Mathematician, biologist, abbot, and founder of genetics garden inheritance traits pea genetics Gregor Mendel was a monk at St. Thomas Abbey. During Mendel's THE LOCATION OF ST. THOMAS ABBEY lifetime, the question of how were passed from one generation to the next was one of the great mysteries of science. Prague Popular ideas to explain included Lamarckism, Brno the idea that acquired traits could be passed on to offspring. Czech Republic In the 1850s, Mendel conducted experiments to discover how inheritance worked. He studied the characteristics of GREGOR MENDEL 1822-1884 plants, such as green and yellow seeds. His experiments were conducted in a small ______ next to the abbey. His conclusions were incredibly advanced for his time and he is widely considered to be the founder of modern

A famous experiment

Peas are self-fertile. They do not need pollinators and unless a person intervenes, the pollen on the stamens will fertilize the stigma and produce a pea pod filled with seeds. To cross-pollinate two different pea plants, Mendel used tweezers to remove the stamens from one flower (1) and used a paintbrush to gather pollen from the flower of a different plant (2). The pollen was then applied to the stigma of the first plant to produce hybrid seeds (3).

If you were Mendel, how would you explain these results? Why is one trait disappearing in the F_1 generation and then coming back again in the next?

Disappearing and reappearing traits?

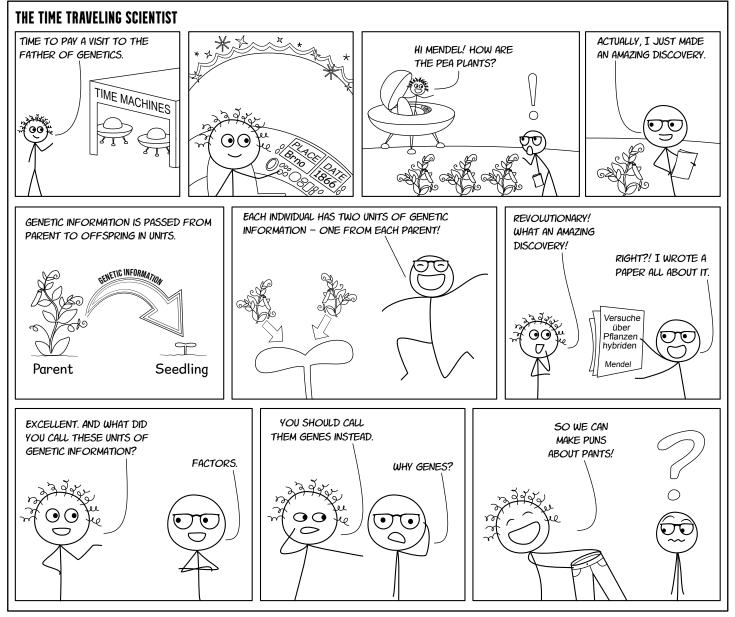

Mendel's results explained

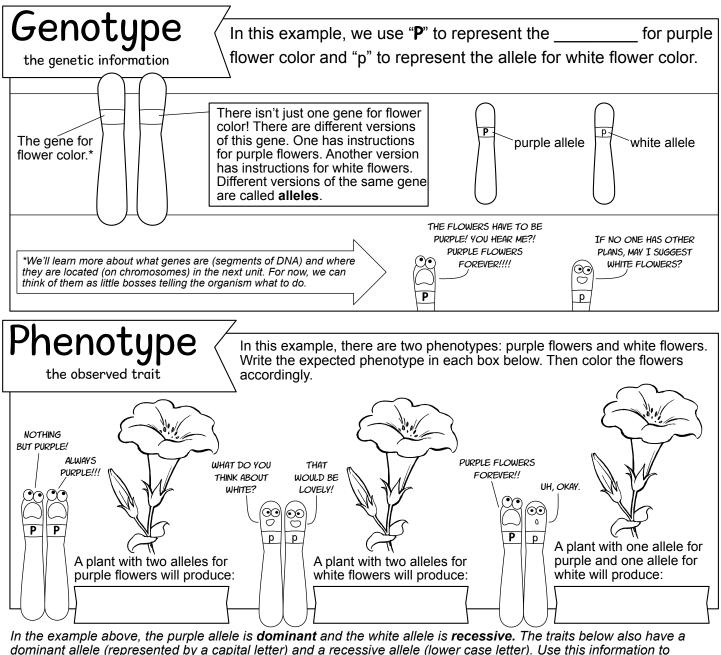

alleles inherited generation ignored traits dominant

When crossing two true-breeding pea plants with different traits, Mendel found that the F₁ or first of plants looked identical to one of the parent plants. The trait from the other parent had "disappeared." But when these plants were self-pollinated, they were no longer true-breeding. Both of the appeared with a consistent ratio: ¹/₄ of the plants had the trait that had disappeared while ³/₄ of the plants had the other trait.

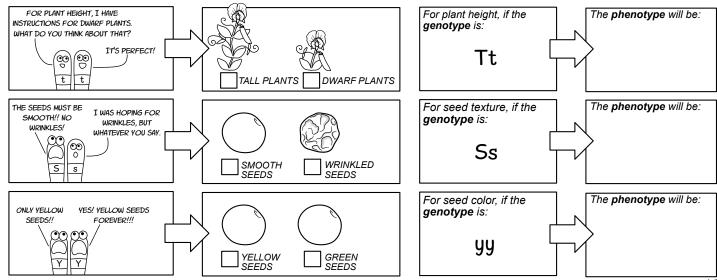

To explain this phenomenon, Mendel said that each plant ______ two factors, one from each parent. Some factors were ______ and others were recessive. Today, we call these factors genes or _____.

He published his research, but it was for more than thirty years. Mendel wasn't recognized for his work until other scientists discovered the same facts in the 1900s.

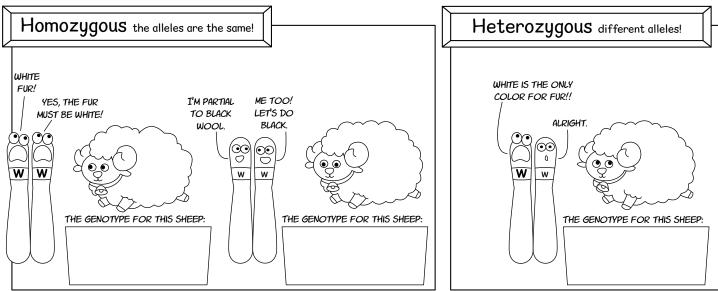

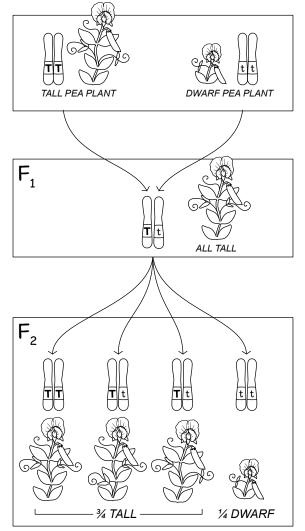

The traits Mendel studied follow a **dominance / recessive** pattern. The trait of wool color in sheep does as well, which explains why black sheep are less common than white. Color in the sheep below with the correct phenotype and then label each block below as either "Homozygous dominant," "Homozygous recessive," or "Heterozygous."

Mendel's results explained (in more detail)

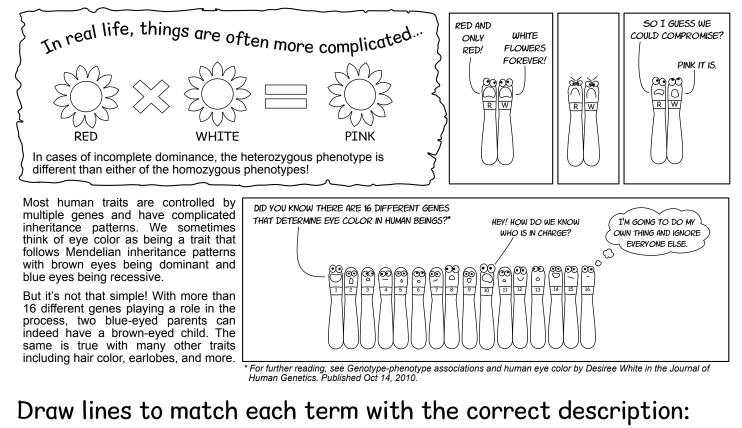

Write either "heterozygous" or "homozygous" in each of the labels below.

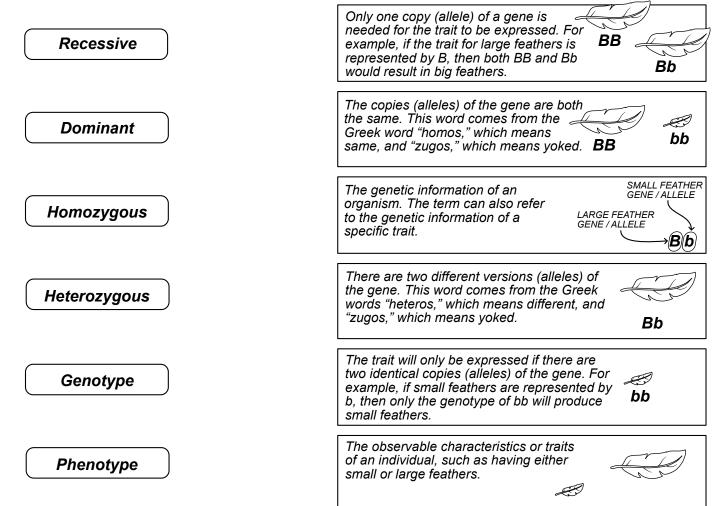

The plants in the parent generation are true-breeding or ______ for their trait, which is plant height. The tall plants always produce seeds that grow into tall plants. The dwarf plants always produce seeds that grow into dwarf plants.

The F_1 generation received one allele from each parent plant and are ______ for plant height. All of the plants in this generation are tall. The plants will be self-fertilized to form the F_2 generation.

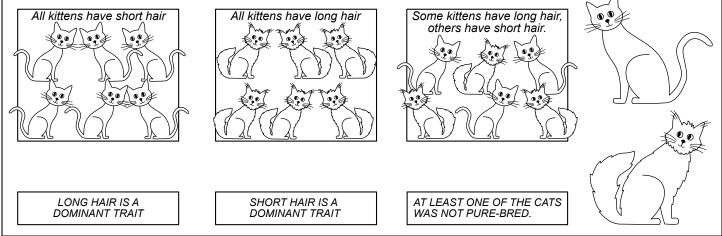

In the F₂ generation, a quarter of the plants show the phenotype of dwarfism. These plants are ______ recessive. Two of the three tall plants are ______, which means they are no longer true-breeding for the trait of plant height.

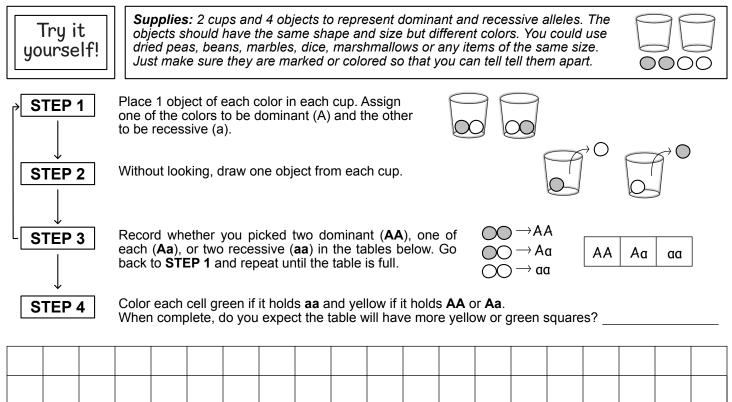

Laws of heredity

Yujun buys two pure-bred cats, each with a pedigree showing that all of their ancestors have the same trait for hair length. One cat is long haired. The other is short haired. Now the cats are going to have kittens. Yujun knows that hair length is a recessive/dominant trait but doesn't remember which trait is dominant. Match each of the possible outcomes with the correct conclusion.

1. SEGREGATION - the alleles are distributed randomly

Mendel's first law states that the chance of inheriting an allele (or genetic factor) is random. For example, in the case of yellow or green seeds in pea plants, if the parent is heterozygous (Yy) there is a 50% chance the offspring will receive the dominant yellow (Y) allele and a 50% chance they will receive the recessive green (y) allele. This is called the principle of segregation.

Mendel's first law predicts 30 yellow (AA and Aa) and 10 green (aa). Were your results similar to this? If you repeated this activity 3 more times, would you expect the overall ratio to be closer to or further away from ³/₄ yellow and ¹/₄ green?

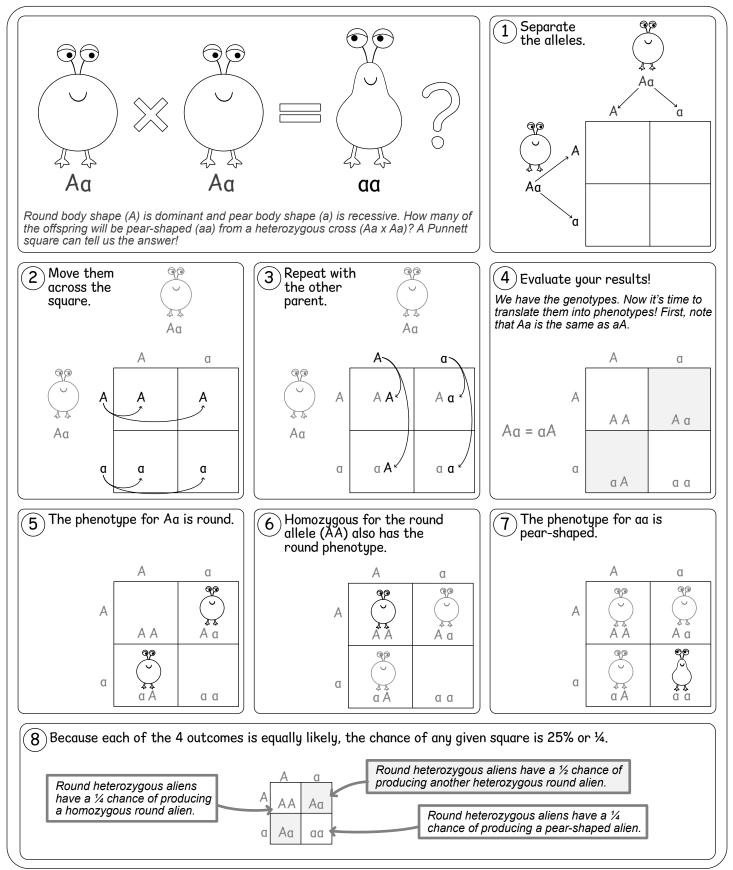

Yellow

Green

Count the number of yellow and green cells in your table.

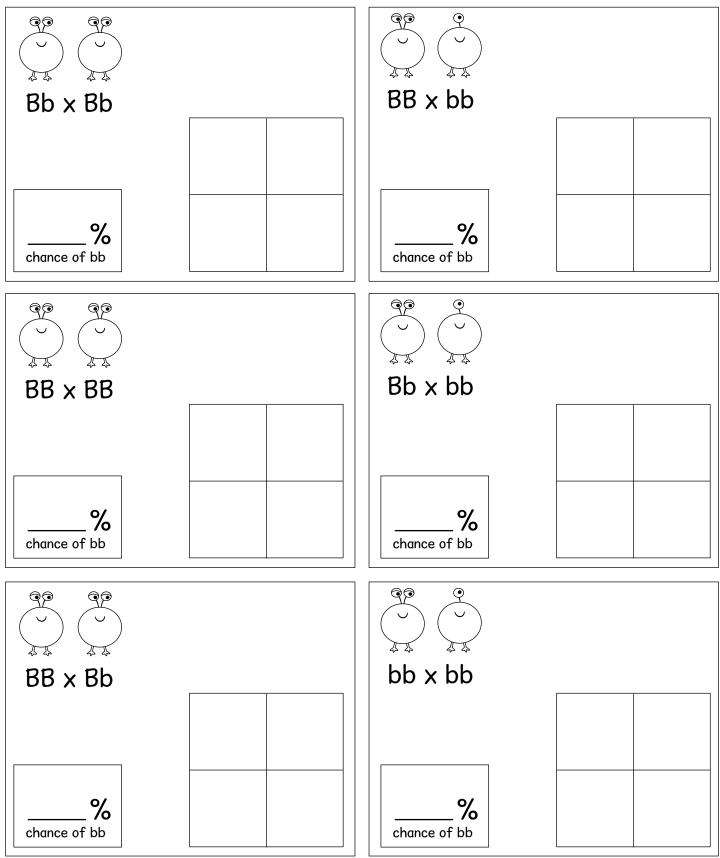

Punnett Squares

Since the probability of getting one allele or another is 50/50, we can use a tool called a Punnett square to see all of the possible combinations AND how likely they are to occur! For example, if a round shape is dominant and pear shape is recessive, a punnet square shows us how likely it is that two heterozygous aliens would produce a pear-shaped alien:

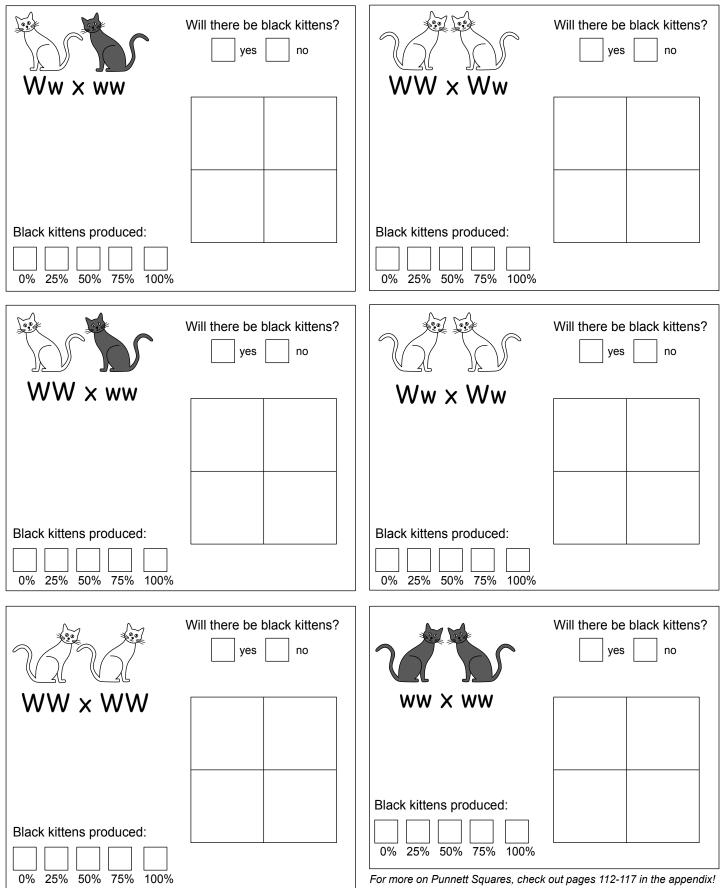

Practice some crosses!

Fill in the Punnett squares for each of the following crosses. Two eyes (B) is a dominant trait. One eye (b) is recessive. Write down the chance of producing a one-eyed alien for each cross. If no squares are "bb," then a one-eyed alien can't be produced from that cross (0% chance). If one square is bb, the chance is 25%. If two squares are bb, the chance is 50%. If three squares are bb, the chance is 75%. If all four squares are bb, the chance is 100%.

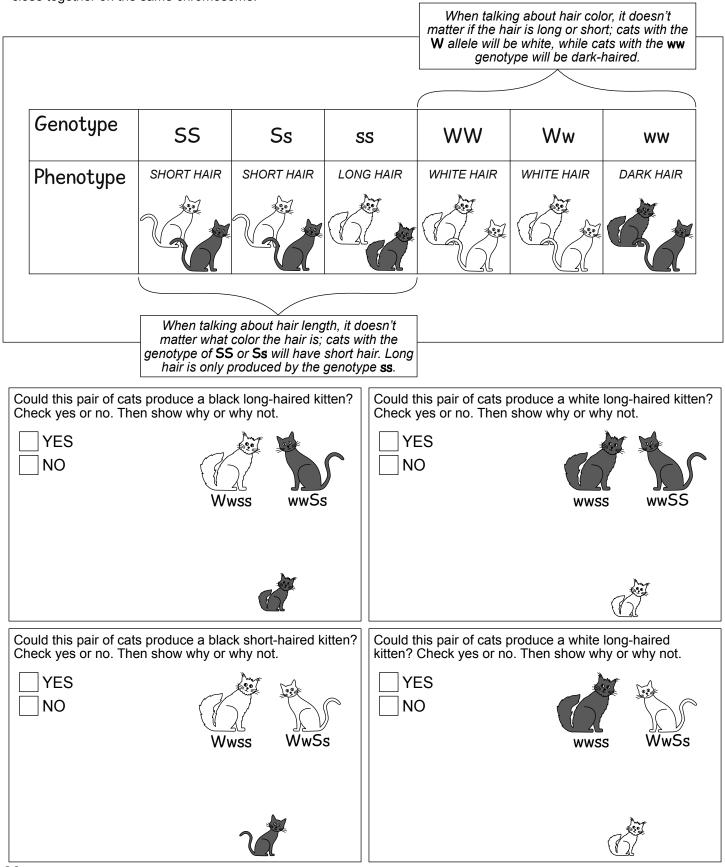

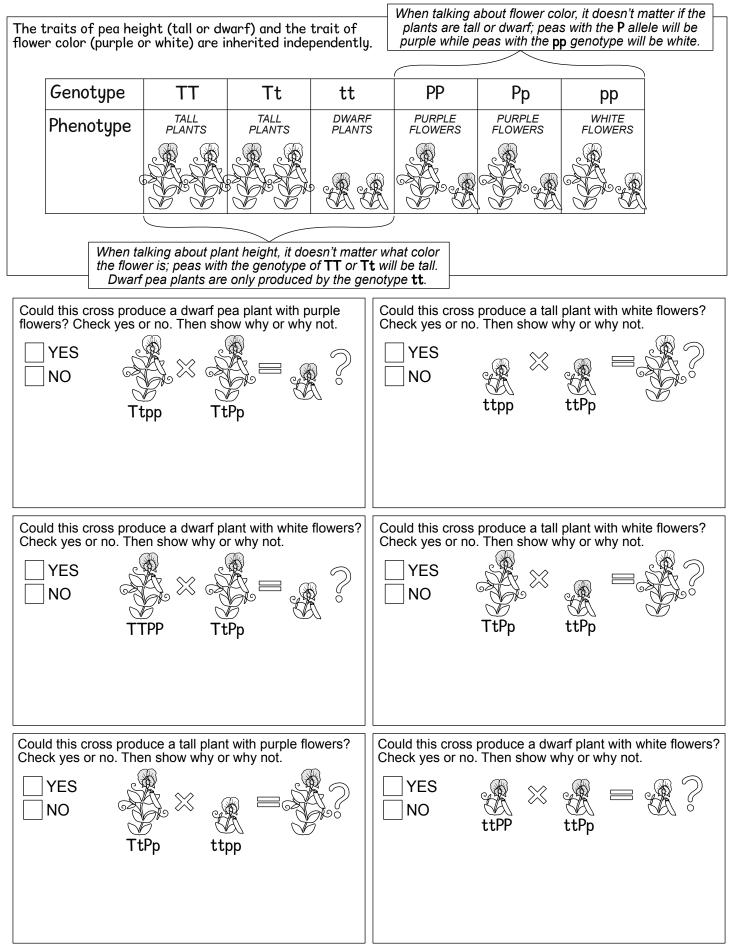

With cats, white fur is dominant (W) and black hair (w) is recessive. **Before** you fill out each Punnett squares, check a box to make a prediction about whether the cross will produce black kittens. **After** filling out the Punnett square, mark the percentage of black kittens the cross produced.

2. INDEPENDENT ASSORTMENT - traits are inherited independently

Mendel's second law of inheritance says that the inheritance of one trait (such as a cat having long hair or short) has no influence on the inheritance of another trait (such as the color of the cat's fur). This is called the principle of independent assortment. It applies to a lot of traits, but not all of them! Some genes are inherited together because they are located close together on the same chromosome.

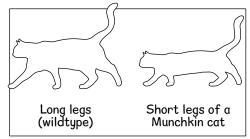

The Munchkin Mutation

Riley is fostering a pregnant Munchkin cat named Percy for their local animal shelter. The short legs of the Munchkin are caused by a dominant mutation (**M**). The mutation is lethal if homozygous (the **MM** genotype fails to develop in utero). Heterozygous (**Mm**) gives the Munchkin phenotype of short legs, and homozygous recessive (**mm**) results in long legs (**wildtype**).

The animal shelter has a waiting list of people ready to adopt Percy's kittens. They want to know what the probability is of the kittens being Munchkins, but no one knows if Percy's mate was a Munchkin (**Mm**) or not (**mm**). Calculate the probability of Munchkin kittens from each possible cross.

What is the probability of Munchkin kittens if both parents are Munchkins?

100% - every kitten will be a Munchkin.

Approximately 67% - 2 out of every 3 kittens will be a Munchkin.

50% - there's a 50/50 chance of the Munchkin trait.

25% - there's a 1 in 4 chance of the Munchkin trait.

What is the probability of Munchkin kittens if one parent is a Munchkin and the other is wildtype (has long legs)?

100% - every kitten will be a Munchkin.

Approximately 67% - 2 out of every 3 kittens will be a Munchkin.

50% - there's a 50/50 chance of the Munchkin trait.

25% - there's a 1 in 4 chance of the Munchkin trait.

If Percy is pregnant with only two kittens, what are the possible outcomes for this litter? Mark all genotype combinations that are possible.

Mm and Mm
Mm and mm
mm and mm

Ethics and Genetics

The study of genetics is about more than traits and DNA. It often impacts social and ethical questions as well. Read the following paragraphs and then write your opinion about the concerns associated with each example. There are no "right" answers here! These questions are as much about what you value as they are about heredity and genetics.

A group of dog breeders have developed a new dog breed called a Tardal.* In working to establish the Tardal as an officially recognized breed, full health histories are completed for all Tardal dogs. The studies reveal that Tardals are intelligent, loyal, and have the fastest running speed of any dog on Earth, capable of running at 70 mph. But in addition to these desirable traits, Tardals are 11x more likely than other dogs to experience hip and ankle dislocation. They also have a life expectancy that is significantly shorter than other dogs, living for just 4 to 5 years.

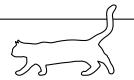

Should this new dog breed be accepted, a move that would cause it to become a common breed among dog owners? Or should people stop breeding Tardals be because of the health concerns (associated with the breed? Write your recommendation:

*The Tardal is an imaginary dog breed invented for this lesson.

Remy breeds ball pythons and in one of their recent clutch of eggs they discovered a scaleless snake. Rare python morphs are valuable and Remy knows they can earn money by breeding the snake to produce more pythons without scales. But this scale-less snake has incredibly soft skin. It needs special care when shedding to avoid infection. Even with soft bedding, it is easily injured and often experiences minor cuts and scrapes from everyday movements.

Do you think Remy should breed the scale-less snake? Why or why not?

The Governing Council of the Cat Fancy^{*} currently refuses to recognize Munchkins as a breed because of health issues associated with the short legged trait. Some Munchkin owners claim that the cats are healthy and happy with no more health concerns than the average cat. Others claim that the mutation hinders Munchkins ability to move and causes discomfort.

WRINKLY

SOFT SKIN

()

A PYTHON WITH NO SCALES!

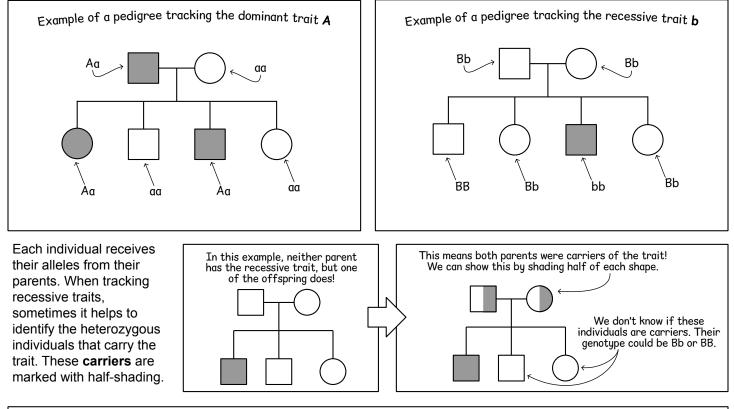

If you were a member of the GCCF, would you be in favor of recognizing Munchkins as a breed, be neutral on the issue, or be in favor of prohibiting further breeding of Munchkins?

*An organization that registers pedigreed cats in the United Kingdom

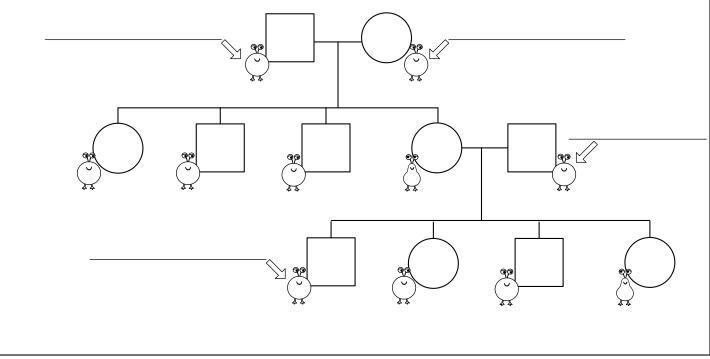

How to Read A Pedigree Chart

A pedigree chart is a family tree that tracks how a trait has been passed along. It typically follows the rules below:

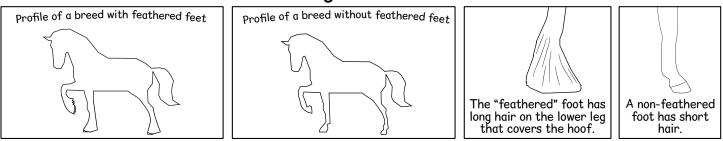

- Males are represented by squares, and females are represented by circles.
- A filled shape means the individual exhibits the trait.
- Horizontal lines between two individuals exhibit mating pairs.
- Vertical lines descend from parents to a horizontal line that connects the offspring.

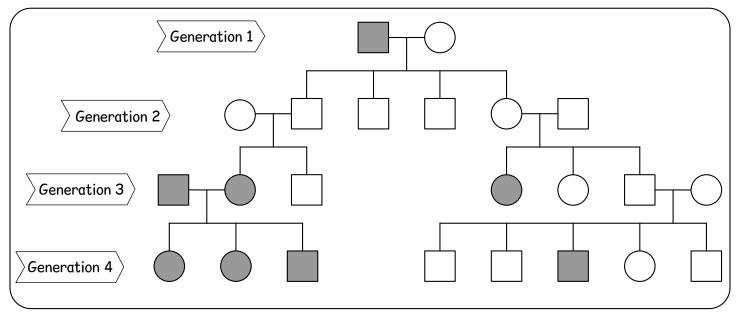

Color in this pedigree for tracking **pear shape** in the aliens. Remember, round body shape is dominant (RR) and pear shape is recessive (rr). The phenotype is known for all individuals. Can you determine the genotypes of the aliens indicated by the arrows?

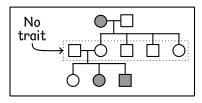

Pet Pedigree Puzzle #1

Below is a pedigree chart for the trait of "feathered feet," the long hair that cover the hooves of certain horse breeds like Clydesdales, Shires, Friesians, and Ardennes.* Each shaded shape represents a horse with feathered feet.

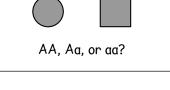

Can a dominant trait skip a generation? What about a recessive trait? Explain.

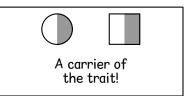

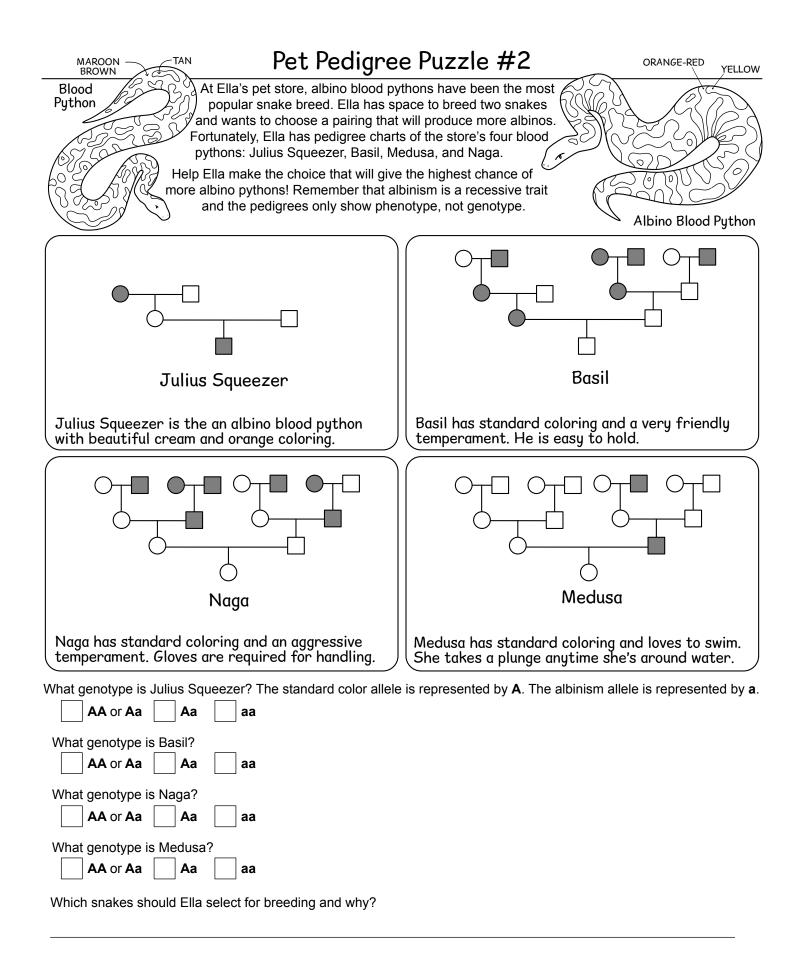

Is the trait mapped in this pedigree chart dominant or recessive? Explain how you know.

When tracking a recessive trait, a half-shaded shape is used to indicate a carrier. Can you identify a horse or horses in this pedigree that must be carriers of the trait? If yes, shade in their shapes.

*While a cross between a feathered horse (such as a Clydesdale) and a non-feathered horse (such as a Thoroughbred) will result in a horse that is non-feathered, the genetics of feathering have not been studied in detail. It's likely to include more than one gene and be more complicated than the hypothetical example used here!

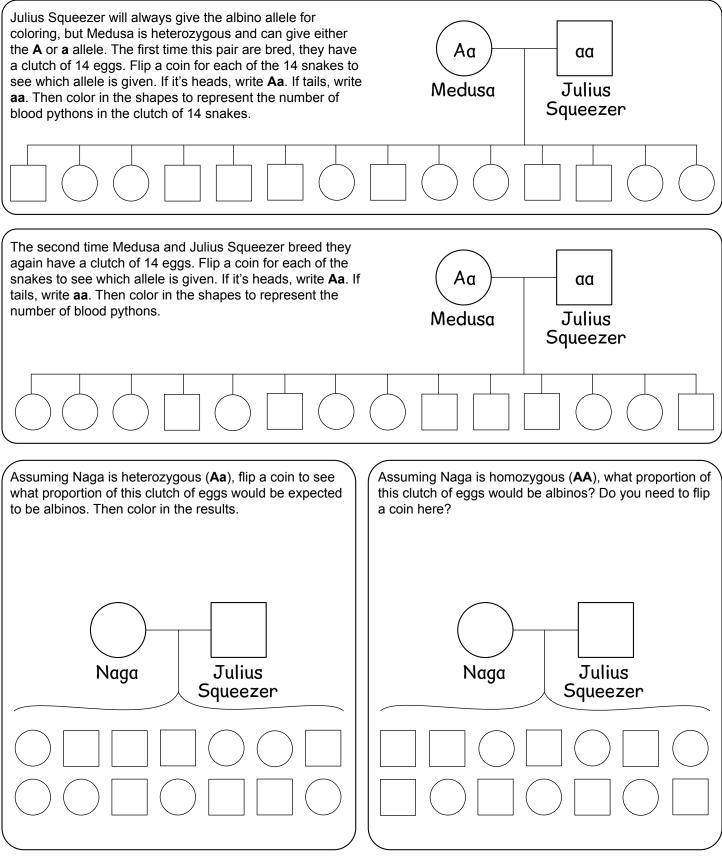

Mendel's First Law is like flipping a coin...

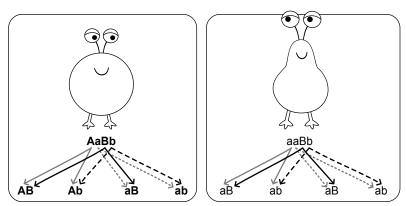

The probability of an aa x Aa cross giving albino snakes may be 50/50, but that doesn't mean you'll see that exact ratio in real life! Explore Mendel's first law by using a coin to determine whether these snakes produce albino blood pythons. Color the albinos (**aa**) orange. Use brown to mark the standard coloring (**AA** or **Aa**) which is also called **wildtype**.

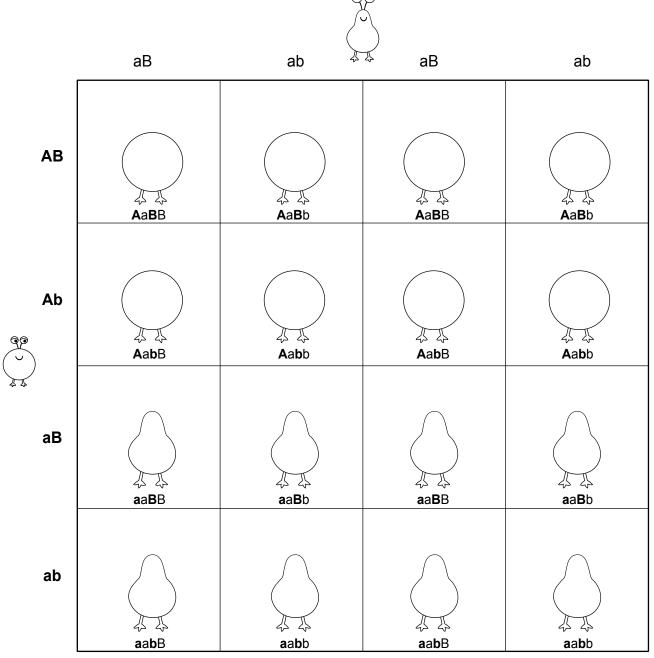

Bigger Punnett Squares!

When we consider two traits at once, we concatenate (or join) the genotypes. For example, an alien that is double heterozygous for roundness (**Aa**) and number of eyes (**Bb**) has the genotype **AaBb**. An pear-shaped alien that is heterozygous for eyes would have the genotype **aaBb**.

The double heterozygous alien has an equal chance of passing along each of the 4 allele pairs: **AB**, **Ab**, **aB**, and **ab**. The pear-shaped alien also has an equal chance of passing on each of the 4 possible allele pairs.

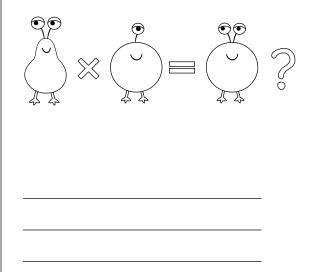

Fill in the punnet square below by drawing the correct number of eyes on each alien for the cross AaBb x aaBb. Remember BB or Bb result in the phenotype of two eyes, and only bb gives the phenotype of one eye.

	Genotype:	Phenotype:	Genotype:	Phenotype:		٦
	AA	Round body shape	BB	Two eyes	\mathbf{P}	
\bigcirc	Aa	Round body shape	Bb	Two eyes	ବ୍ତ	
329	аа	Pear body shape	bb	One eye	Ŷ	66

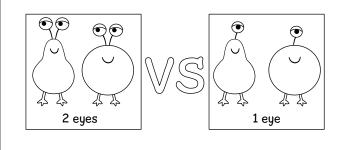

Create a Punnett square for the cross AaBb×AaBb. Will you see the rare pear-shaped one-eyed alien (aabb) from this cross? If so, what is the chance of seeing it? 1/16, 2/8, 1/4 or 1/2?

Create a Punnett square for the cross **aaBb** × **Aabb**. What is the chance of seeing a round two-eyed alien (**AaBb**) from this cross?

	Genotype:	Phenotype:	Genotype:	Phenotype:		7
	AA	Round body shape	BB	Two eyes	\mathbf{P}	
\bigcirc	Aa	Round body shape	Bb	Two eyes	ବ୍ତ	
228	аа	Pear body shape	bb	One eye	P	

Create a Punnett square for the cross **AABb**×**AaBb**. How many of the offspring, on average, will have one eye? 1/16, 2/8, 1/4 or 1/2? Will there be any pear-shaped one-eyed aliens or will they all be round?

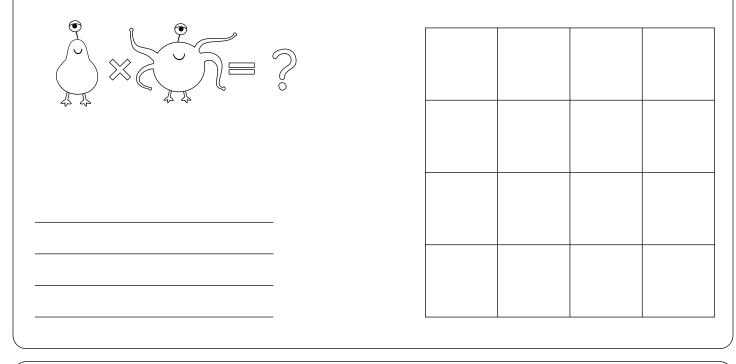

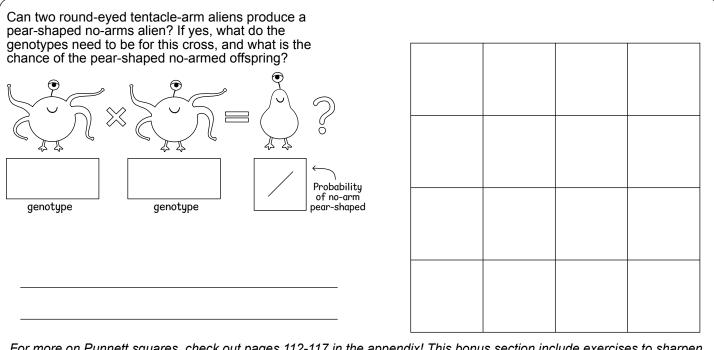

Create a Punnett square for the cross **aabb** × **AABB**. What is the chance of seeing a round two-eyed alien that is heterozygous for both traits (**AaBb**)?

	Genotype:	Phenotype:	Genotype:	Phenotype:	7
	AA	Round body shape	сс	Tentacle arms	
	Aa	Round body shape	Сс	Tentacle arms	
	аа	Pear body shape	сс	No arms	

A new dominant trait of tentacle arms has been discovered. What will be the results of a cross between a heterozygous tentacled round alien and a pear-shaped no-arms alien? (**aacc**×**AaCc**) Fill out the square, then write the ratios for each of the outcomes.

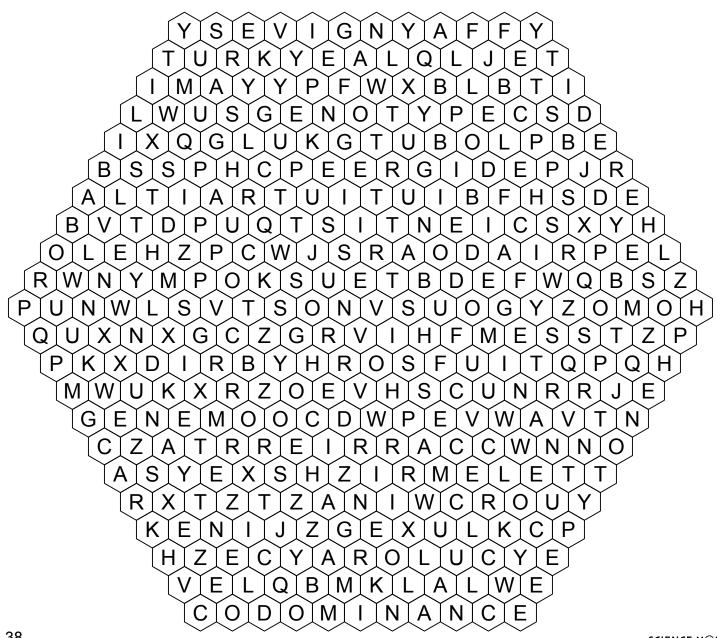

For more on Punnett squares, check out pages 112-117 in the appendix! This bonus section include exercises to sharpen your skills for calculating probabilities, and templates for a tryhybrid and tetrahybrid cross!

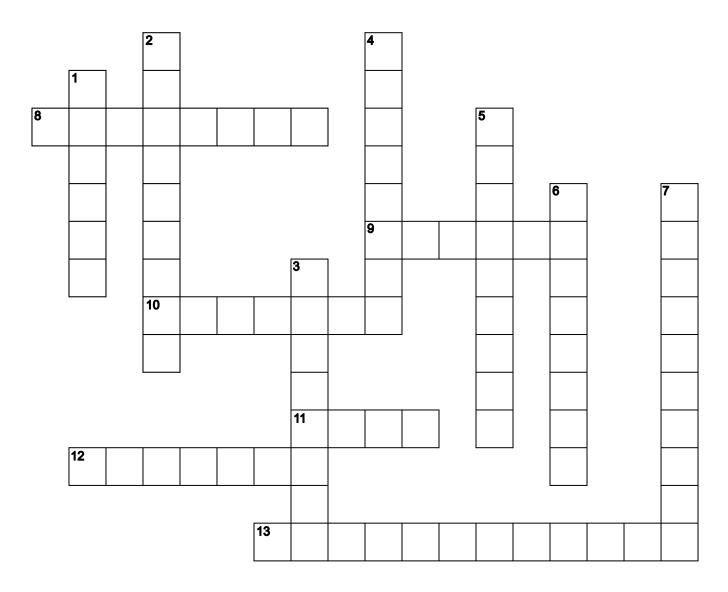

Heredity Word Search

There are a lot of new words to learn when studying biology. Repetition is the best way to learn them, and word games can be part of that! Find each of the hidden words in the word-search. The words can run in any direction: horizontal or diagonal, and the letters might go left to right or right to left!

GENE	RECESSIVE	CARRIER PROBABILITY HEREDITY OFFSPRING TRAIT	
ALLELE	PHENOTYPE		
HOMOZYGOUS	GENOTYPE		
HETEROZYGOUS	CODOMINANCE		
PUNNETTSQUARE	PEDIGREE		
DOMINANT	HYBRID		

Heredity Crossword Puzzle

VERTICAL Words

- 1. What is the name of the father of genetics?
- 2. What is the term for an organism's physical appearance or visible traits?
- 3. The name for a chart of the ancestry or heritage of an individual.
- 4. A trait that will appear in the offspring if one of the parents contributes an allele for it.
- both parents contribute an allele for it.
- 6. The scientific study of heredity.
- 7. The term for the condition where both copies of the allele are the same.

HORIZONTAL Words

- 8. The passing of traits from parents to offspring.
- 9. The term for a possible form of the gene.
- 10. A type of square used to keep track of the possible combination of alleles that can result from a cross.
- 11. A segment of DNA on a chromosome that codes for a specific trait.
- 5. A trait that will only appear in the offspring if 12. A person who has one recessive allele for a trait and one dominant allele, but does not have the trait.
 - 13. The term for the condition where there are two different alleles for a trait.

ANSWER THE QUESTIONS TO SEE WHAT YOU LEARNED ABOUT HEREDITY!

(1) Which statement is true?

- A. Members of the same species must be approximately the same size.
- B. Members of the same species can breed with each other and produce offspring.
- C. Scientists always agree on whether animals are in the same species.
- D. Only animals have species.

Which type of reproduction will result in the most genetic diversity?

- A. Fragmentation
- B. Binary fission
- C. Vegetative propagation
- D. Spore formation
- E. Sexual reproduction

3 Every trait is controlled by a single gene, and each gene is determined by two alleles.

- A. True
- B. False

(4) Select each true statement below.

- A. A dominant trait can skip a generation.
- B. A recessive trait can skip a generation.
- C. When two parents share the same genotype, their offspring will share the same genotype.
- D. When two parents share the same phenotype, their offspring will share the same phenotype.

5) What does the notation BB mean to a geneticist?

- A. Two dominant alleles
- B. Two recessive alleles
- C. At least one dominant allele
- D. One dominant and one recessive allele

6 If a homozygous black guinea pig (BB) is crossed with a homozygous white guinea pig (bb), what is the probability that an offspring will have black fur?

- A. 0%
- B. 25%
- C. 50%
- D. 75%
- E. 100%

- If an organism is homozygous dominant for a trait that follows Mendelian inheritance patterns, which of the following must be true?
 - A. Its offspring will also have a homozygous genotype.
 - B. Its offspring will also have a heterozygous genotype.
 - C. Its offspring will exhibit the dominant phenotype for the trait.
 - D. The organism's parent(s) also had a homozygous genotype for the trait.
 - E. None of the above

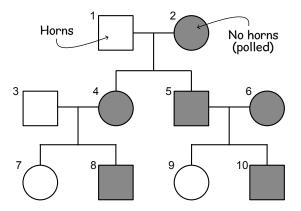

8) Select each true statement below.

- A. If you know an organism's genotype for a trait, then you also know its phenotype.
- B. If you know an organism's phenotype for a trait, then you also know its genotype.
- C. A parent always has the same genotype as its offspring.
- D. A parent always has the same phenotype as its offspring.
- An organism that has two different alleles for a single trait is said to be ______ for that trait.
- An organism has a phenotype for a dominant trait while some of its offspring have the phenotype for the recessive trait. What can we conclude about this organism?
 - A. It is heterozygous for the trait.
 - B. It is homozygous dominant for the trait.
 - C. It is homozygous recessive for the trait.
 - D. There is not enough information to tell.
- True or False: all alleles are either dominant or recessive.
 - A. True
 - B. False

(12) What is a Mendelian trait?

- A. A trait that involves alleles
- B. A trait that is passed down by dominant and recessive alleles of one gene
- C. A trait where different alleles are equally and independently expressed
- D. A trait exhibited by pea plants

Below is a pedigree chart for tracking **hornless cattle**, a Mendelian trait. Cattle without horns are called *polled* cattle and are usually viewed as more desirable than cattle with horns. Each of the cattle is numbered for reference.

- $\widehat{\mathbf{13}}$ Is the hornless trait (polling) a dominant or recessive trait in cattle? Explain how you know.
- 14 We can assign the alleles A and α to the trait "no horns" exhibited in the pedigree chart. In that case, what is the specific meaning of both A and α?
- 15 Label each member of the pedigree chart whose genotype can be fully identified. Are there any that you can't determine? Explain.
- (16) List the numbers of each individual that has horns in the pedigree above:
- **17)** List the numbers of the individuals that are heterozygous in the pedigree above:
- (18) If we cross two cattle with horns, could the offspring have no horns? Explain.
- (19) If we cross two cattle with no horns, could the offspring have horns? Explain.
