

# CHEMISTRY

The central and most important branch of science

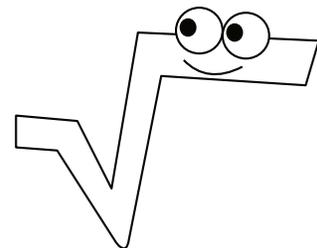

MOST CENTRAL SCIENCE!?!? THAT WOULD CLEARLY BE BIOLOGY.

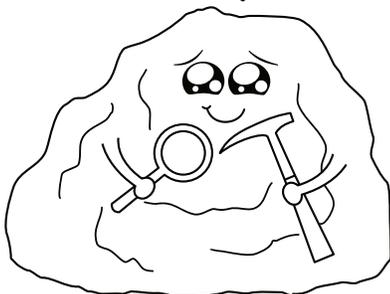

DON'T BE RIDICULOUS. WITHOUT PHYSICS YOU WOULDN'T EVEN HAVE A PLANET TO LIVE ON!

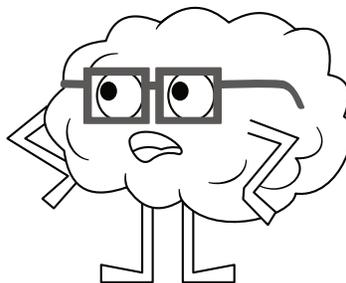

MATH IS OBVIOUSLY THE MOST IMPORTANT.

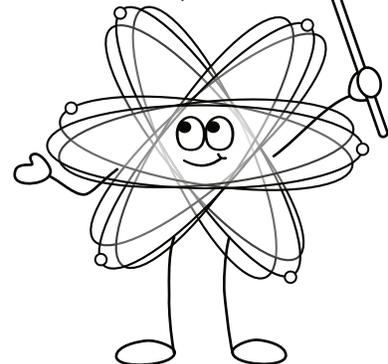

ROCKS ARE AWESOME!

THAT'S YOUR BEST ARGUMENT FOR GEOLOGY? REALLY? YOU JUST PROVED THAT THERE'S NOTHING MORE IMPORTANT THAN PSYCHOLOGY.

COMPLAIN ALL YOU WANT - THIS CLASS IS DEDICATED TO ME!!!

# Chemistry Club

~ THE ZOOM CLASS! ~

	Date	Topic	Page
Week 1	<b>Tuesday, August 23</b>	Zoom class: orientation and class overview. Meet your classmates and choose the theme for our quiz shows!	
	<i>On your own schedule</i>	1. The story of the atom	1-2
	<i>On your own schedule</i>	2. Elemental, dear Watson!	3-4
Week 2	<b>Tuesday, August 30</b>	<b>Zoom class: Modeling Clay Orbitals (replaces video 3)</b>	5-6
	<i>On your own schedule</i>	4. A noble quest	7-10
	<i>On your own schedule</i>	5. Why share electrons?	11-12
Week 3	<b>Tuesday, September 6</b>	<b>Zoom class: Quiz show (replaces video 6)</b>	
	<i>On your own schedule</i>	7. Element vs Mixture vs Compound	17-18
	<i>On your own schedule</i>	8 What is radioactivity?	19-20
Week 4	<b>Tuesday, September 13</b>	<b>Zoom class: going bananas</b>	
	<i>On your own schedule</i>	9. Edible experiments	15-16
	<i>On your own schedule</i>	10. States of matter	21-22
Week 5	<b>Tuesday, September 20</b>	<b>Zoom class: matter batter</b>	
	<i>On your own schedule</i>	11. Physical Reactions	23-24
	<i>On your own schedule</i>	12. Fizzing experiments	25-26
Week 6	<b>Tuesday Sept 27</b>	<b>Zoom class: what's a reaction?</b>	
	<i>On your own schedule</i>	13. Chemical reactions	27-29
	<i>On your own schedule</i>	14. More chemical reactions	30
Week 7	<b>Tuesday, October 4</b>	<b>Zoom class: lemon battery (replaces video 15)</b>	31-32
	<i>On your own schedule</i>	16. Toasters and cooking mysteries	33-34
	<i>On your own schedule</i>	17. Carbon, the building block of life	35-36
Week 8	<b>Tuesday, October 11</b>	<b>Zoom class: Quiz show (replaces video 18)</b>	
	<i>On your own schedule</i>	19. Where do fossil fuels come from?	37-39
	<i>On your own schedule</i>	20. What is fire really?	40
Week 9	<b>Tuesday, October 18</b>	<b>Zoom class: Build a levee (replaces video 21)</b>	41-42
	<i>On your own schedule</i>	22. The chemistry of lava	43
	<i>On your own schedule</i>	23. The chemistry of acids and bases	44

Chemistry club is a blend of pre-recorded and live classes. The numbered video lessons can be found at <https://science.mom/chemvids> and watched at any time during or before their corresponding week.

	<b>Date</b>	<b>Topic</b>	<b>Page(s)</b>
Week 10	<b>Tuesday, October 25</b>	<b>Zoom class: Quiz show (replaces video 24)</b>	
	<i>On your own schedule</i>	25. Chemistry of swimming pools	45
	<i>On your own schedule</i>	26. Photosynthesis	46
Week 11	<b>Tuesday, November 1</b>	<b>Zoom class: Frankenseeds (replaces video 27)</b>	47-48
	<i>On your own schedule</i>	28. All about sugars	49
	<i>On your own schedule</i>	29. Why can't you eat books?	50-51
Week 12	<b>Tuesday, November 8</b>	<b>Zoom class: Quiz show (replaces video 30)</b>	
	<i>On your own schedule</i>	31. Lipids	52
	<i>On your own schedule</i>	32. Plankton	53
Week 13	<b>Tuesday, November 15</b>	<b>Plant propagation (replaces video 33)</b>	54-55
	<i>On your own schedule</i>	34. Why things glow in the dark	56
	<i>On your own schedule</i>	35. <i>From cells to colonies</i>	57
Week 14	<i>Tuesday, November 22</i>	<i>No class: Thanksgiving break</i>	
Week 15	<b>Tuesday, November 29</b>	<b>Zoom class: Quiz show (replaces video 36)</b>	
	<i>On your own schedule</i>	37. Nitrogen cycle	58
	<i>On your own schedule</i>	38. Water reclamation	59
Week 16	<b>Tuesday, December 6</b>	<b>Zoom class: water chemistry</b>	
	<i>On your own schedule</i>	39. DIY water filter	60
	<i>On your own schedule</i>	40. Fireworks and safety	61
Week 17	<b>Tuesday, December 13</b>	<b>Zoom class: Quiz show (replaces 41 and 42)</b>	

You will see boxes like this through out the notes. Use them to draw your favorite moment from class, to write down something cool you learned, or for plain old-fashioned doodling. If you'd like to share your doodle work with Science Mom and Math Dad, take a picture and then tag us on social media or email it to [art@science.mom](mailto:art@science.mom)

**YOUR DOODLE SPACE**

# Supply List for Hands-on Activities:

## **Week 2 - Modeling Clay Orbitals**

- Toothpicks
- Modeling clay or play dough (7 different colors)

## **Week 4 - Edible Experiments**

- Granulated Sugar (at least 7 cups)
- Kool-aid packets
- Cake pop sticks or string
- A ruler
- 2 pint-size mason jars with lids OR cups and rubber bands
- Coffee filters or paper
- 2 Microwavable popcorn packets

## **Week 5 - Time to Fizz!**

- 6 Alka-Seltzer tablets
- 6 bottles of soda in plastic containers with narrow tops. Any size and type will work, but I recommend 16 oz coke bottles (because Coke is slightly more carbonated than other sodas). You'll use the bottles twice in this experiment and reuse two of them again in the Dec 4<sup>th</sup> water filtration experiment.
- Baking soda
- 3 packages of Pop Rocks candy
- 6 Balloons (standard 9 inch size)
- A funnel (to help get baking soda inside the balloon)
- Food Coloring
- Vinegar
- Vegetable oil (a whole bottle)
- Safety glasses

## **Week 7 - Lemon or Vinegar Batteries**

- Citrus fruit such as lemons OR a potato OR vinegar and an empty ice cube tray

- An LED diode
- Copper penny, wire, or copper sheets
- Galvanized nail or zinc sheets
- Alligator clips
- Scissors or knife

*You can get all of these items in a "lemon battery science kit" online for between \$5 and \$9.*

### ***Week 9 - Build a Levee***

- A rectangular Tupperware container (or a glass pan)
- Duct tape
- A plastic bag
- Fine-grained building materials (1 cup flour mixed with 1 Tbsp cocoa powder)
- Course grained building materials (beans, nuts, or dried fruit)
- Water
- (Optional) legos or other small items to represent the town

### ***Week 11 - Frankenseeds***

- Cardboard egg carton(s)
- Paper towels
- An empty bread or produce bag
- At least 6 types of seeds from the kitchen (could include rice, beans, lentils, chia seeds, walnuts, sunflower seeds, almonds, peanuts, flax seeds quinoa, or seeds from inside foods like apples, peas, avocados, pears, oranges, kiwis, or cucumbers)

### ***Week 13 - Plant Propagation***

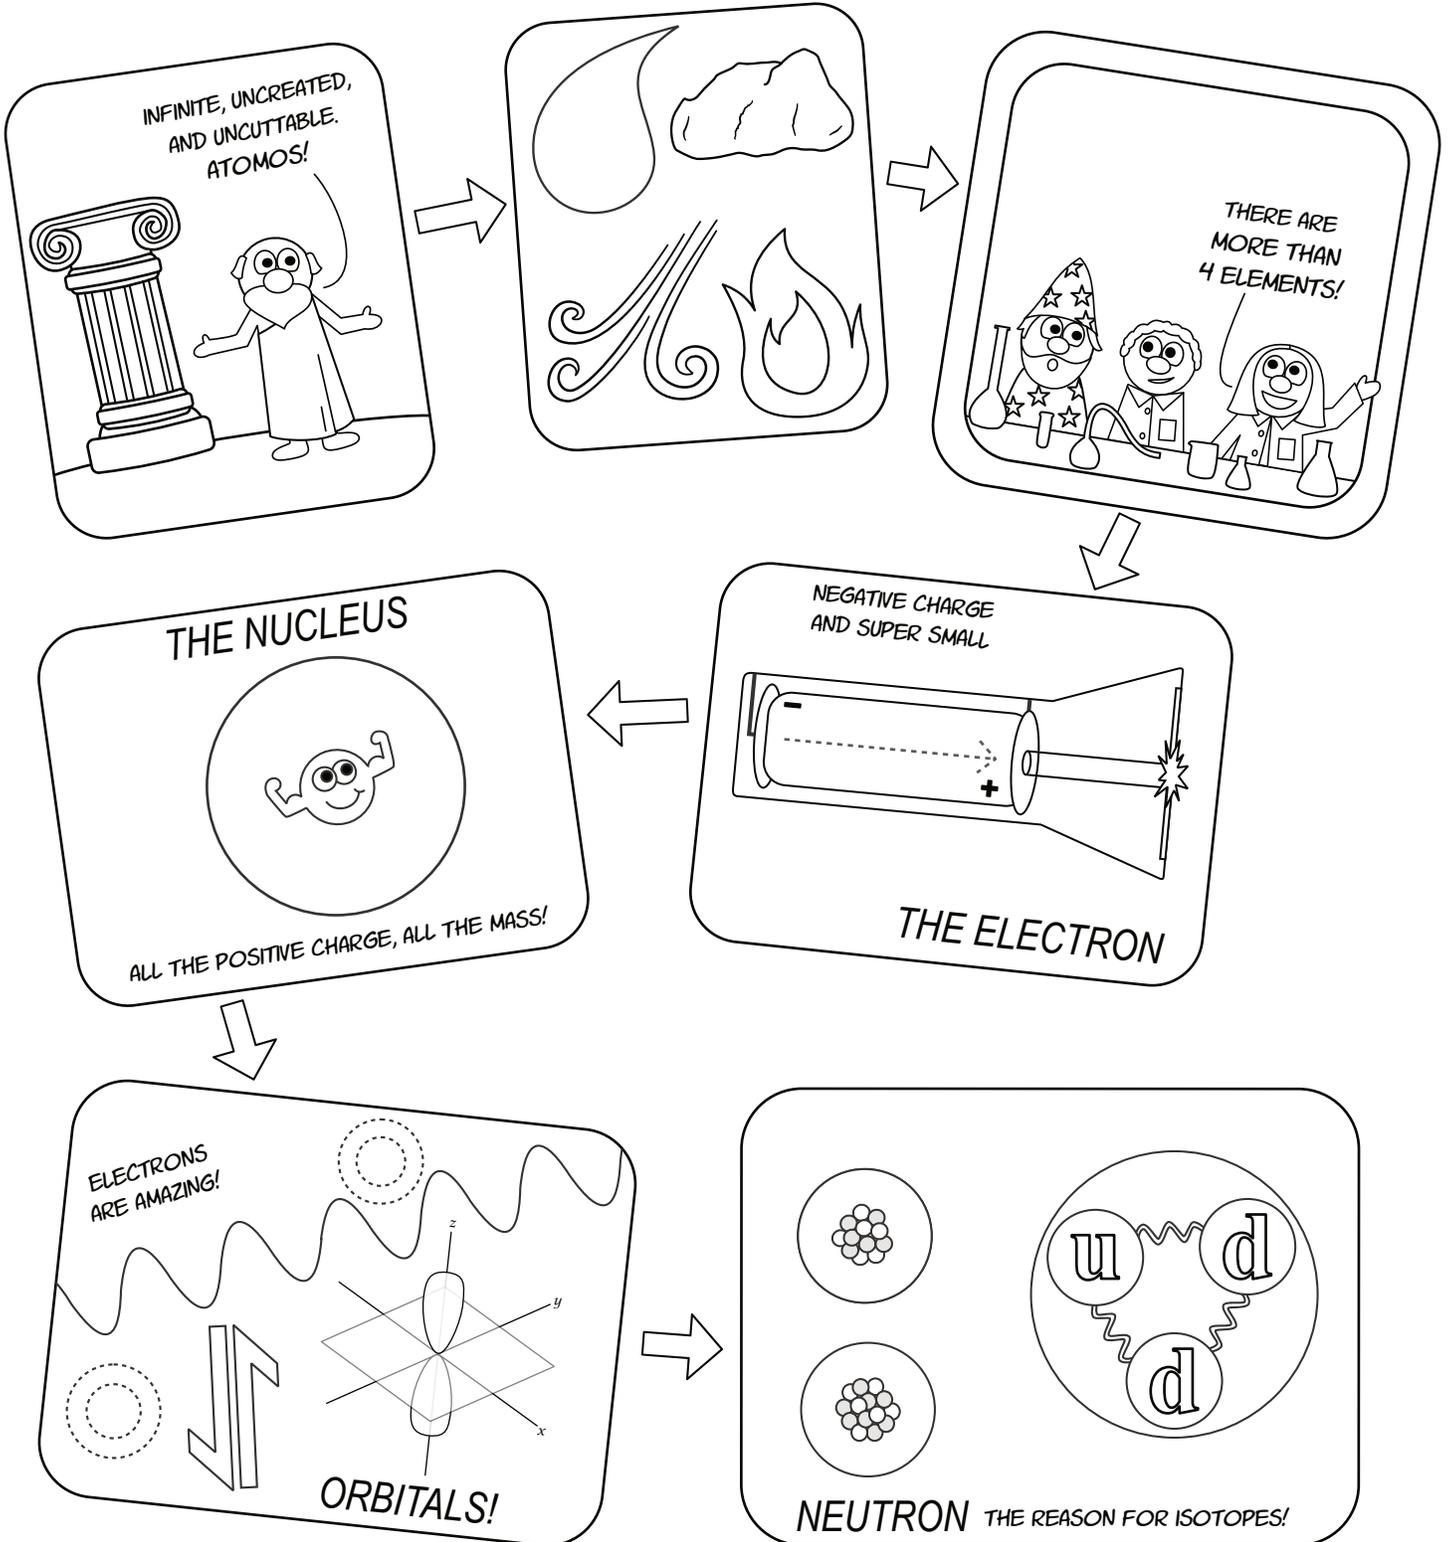

- One root vegetable (such as a carrot, beet, turnip, radish, or rutabaga)
- One tuber (sweet potato, potato, ginger, or turmeric)
- A pineapple
- 3 cups (drinking cups will work fine)
- Toothpicks

### ***Week 16 - DIY Water Filter***

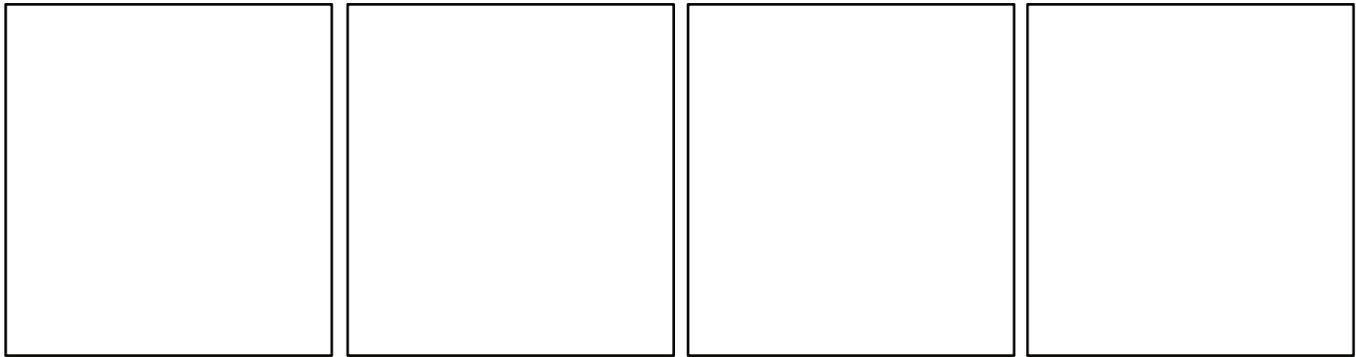

- Two plastic 12 or 16 oz bottles (can reuse the ones from Sept 25)
- Scissors (you might want an adult's help to cut the bottles)
- Sand
- Gravel
- Activated charcoal
- Coffee filters
- A small square of cotton fabric or a couple of cotton balls

# The story of the ATOM

WHAT ARE THINGS REALLY MADE OF?

DRAW THE DIFFERENT MODELS IN THESE BOXES!

SOLID SPHERE	PLUM PUDDING	PLANETARY	BOHR
<p>1803 JOHN DALTON</p> <p>✓ ELEMENTS ARE MADE OF DIFFERENT ATOMS</p> <p>✗ THE ATOM ISN'T THE SMALLEST PARTICLE</p>	<p>1904 J.J. **Welcome to the Elemental Cafe**

**How to order an element:**

- Choose the number of protons\*
- Make it an isotope!  
Adjust the number of neutrons
- Make it an ion!\*\*  
Adjust the number of electrons

\* NUMBERS ABOVE 90 ARE NOT SERVED.  
\*\* LIMITED AVAILABILITY.

*Daily Special*

**CARBON 14**

6 PROTONS  
8 NEUTRONS  
6 ELECTRONS

Remarkably stable!

WHAT CAN I GET YOU?

I'LL HAVE A NUMBER TWO.

HELIUM? SURE! DO YOU WANT TWO NEUTRONS OR THREE?

UH, I DON'T KNOW.

TWO NEUTRONS WILL BE \$5. THREE IS \$5,000.

TWO NEUTRONS PLEASE!

FILL IN THE BLANKS USING THESE WORDS:

element	positive	no	nucleus	orbitals	neutrons
nucleus	protons	nucleus	118	matter	negative

**ELECTRONS**  
HAVE A \_\_\_\_\_ CHARGE AND OCCUPY SPACES AROUND THE NUCLEUS KNOWN AS \_\_\_\_\_. THEY DON'T ADD ANY REAL MASS TO THE ATOM.

**PROTONS**  
HAVE A \_\_\_\_\_ CHARGE AND EXIST IN THE \_\_\_\_\_ OF THE ATOM. THE NUMBER OF PROTONS DETERMINES WHICH ELEMENT THE ATOM IS.

**NEUTRONS**  
HAVE A \_\_\_\_\_ CHARGE AND EXIST IN THE \_\_\_\_\_ OF THE ATOM. THEY ARE ABOUT THE SAME SIZE AS PROTONS.

**ATOMS ARE MOSTLY MADE OF EMPTY SPACE. ALL OF THEIR MASS IS IN THE THE \_\_\_\_\_**

**ALL \_\_\_\_\_ IS MADE OF ATOMS. ATOMS ARE THE SMALLEST PIECE OF AN \_\_\_\_\_ THAT STILL BEHAVES LIKE THAT ELEMENT.**

**AN ELEMENT CANNOT BE BROKEN INTO SIMPLER SUBSTANCES BY CHEMICAL REACTIONS. THERE ARE \_\_\_\_\_ KNOWN ELEMENTS.**

**THE NUCLEUS OF THE ATOM CONTAINS \_\_\_\_\_ AND \_\_\_\_\_ BUT NOT ELECTRONS.**

**ISOTOPES ARE VARIATIONS OF THE SAME ELEMENT WITH A DIFFERENT NUMBER OF NEUTRONS.**  
HELIUM      ALSO HELIUM

ARRANGING ALL OF THE ELEMENTS BY NUMBER CREATES A REALLY WIDE TABLE. SO THIS BLOCK (THE LANTHANIDES AND ACTINIDES) IS USUALLY SHOWN BELOW THE REST OF THE ELEMENTS.

# Hands-on Activity

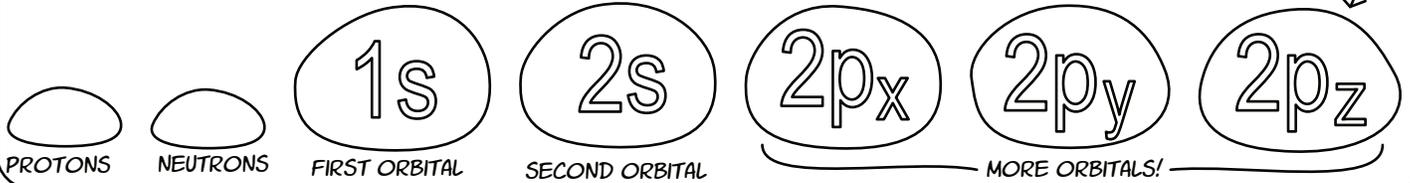

## MODELING CLAY ORBITALS!

### MATERIALS:

TOOTHPICKS

CLAY OR PLAY DOUGH IN SEVEN DIFFERENT COLORS

Don't have modeling clay?  
No problem! Make play  
dough using this recipe:

### PLAY DOUGH

- 1 cup flour
- 1/3 cup salt
- 3/4 cup water
- 3 Tbsp lemon juice
- 1 Tbsp cooking oil
- Food coloring

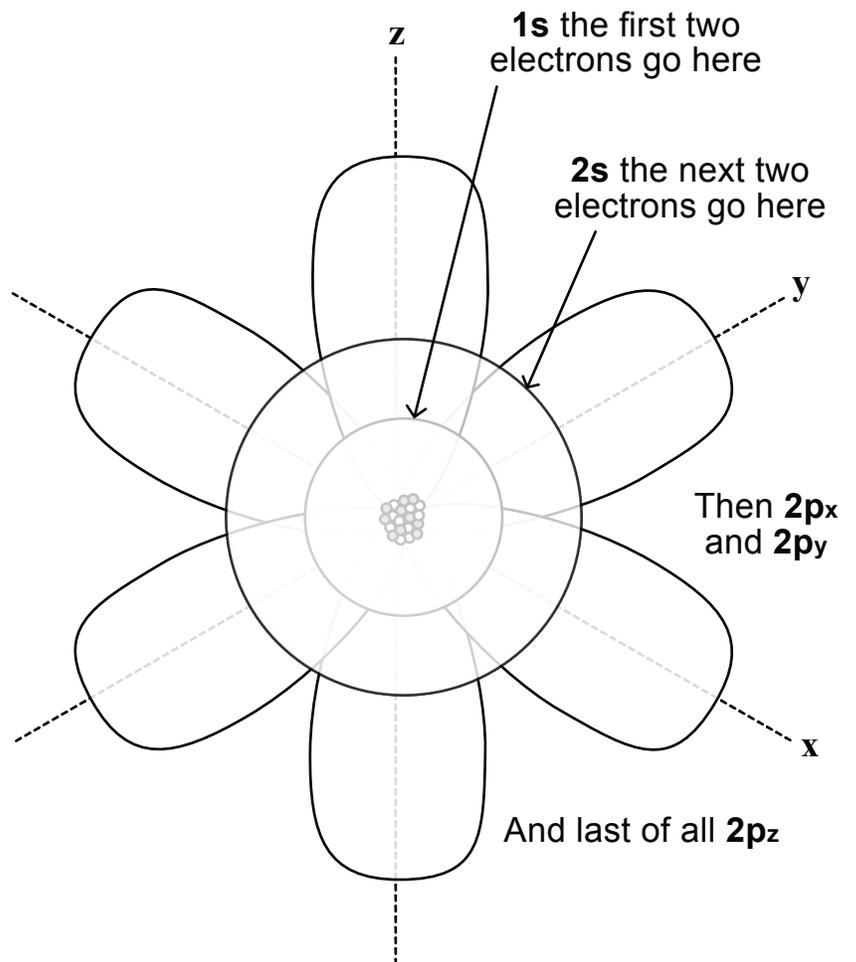

Mix the flour and salt together in a bowl. Heat the water to boiling and add the oil and lemon juice. Then mix all the ingredients together. For best results, mix in a pot over the stovetop until mixture is thick (about 1 minute).

Let sit and cool for a few minutes before kneading. Add another spoonful of flour if the dough is too sticky. Kool-aid drink packets can be used instead of food coloring.

## ORBITALS

WHERE AN ELECTRON IS MOST LIKELY TO BE

~ INSTRUCTIONS ON PAGE 6 ~

SCIENCE M@M

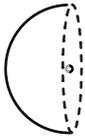

# MODELING CLAY ORBITALS CONTINUED...

## INSTRUCTIONS:

Shape the colors of clay that represent neutrons and protons into small spheres and put them together to make the nucleus. Then cover the nucleus in layers of clay to represent the orbitals. Use the images below to guide you in making models of a hydrogen, helium, lithium, carbon, fluorine, and neon atom. Partially-filled orbitals can be represented by moulding half of the orbital. Use toothpicks to attach the p-orbitals.

- Nonmetals:** These Elements do not conduct electricity. 1, 6, 7, 8, 15, 16, 34
- Alkali Metals:** All of these react explosively with water. 3, 11, 19, 37, 55, 87
- Alkali Earth metals:** These all also reactive elements and especially like to react with oxygen. 4, 12, 20, 38, 56, 88
- Transition metals:** These are good conductors of heat and electricity. And there are a lot of them! 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 72, 73, 74, 75, 76, 77, 78, 79, 80
- Metals:** These are great conductors heating electricity and in their solid form they can are shiny and ductile. 13, 31, 49, 50, 81, 82, 83
- Metalloids:** these elements are semiconductors! 5, 14, 32, 33, 51, 52, 84
- Halogens:** These are very reactive elements. 9, 17, 35, 53, 85
- Noble gases:** These elements have a full show of electrons and are not very reactive. 2, 10, 18, 36, 54, 86
- Transactinides:** Super big elements with more than 104 protons! These have been created artificially in laboratories, but are not found in nature. 104-118
- Lanthanides:** Called the rare earth elements. 57-71
- Actinides:** These are all radioactive. 89-103

A FULL SHELL OF ELECTRONS IS LIKE A HAPPY TURTLE - UNLESS IT GETS TOO BIG.

An \_\_\_\_\_ with a full shell is stable. It is not interested in reacting with other elements. But if it gets too large, then that “turtle” is no longer very happy, even though it has a full shell.

The elements with \_\_\_\_\_ shells of electrons are in the column called the noble gases. Next to the noble gases are the \_\_\_\_\_. If these elements *gain* one more electron, then they have a full shell. If the

\_\_\_\_\_ \_\_\_\_\_ *lose* one electron, then they have a full shell. Both groups or families of elements are very \_\_\_\_\_. They want to \_\_\_\_\_ with other elements and fill their shells!

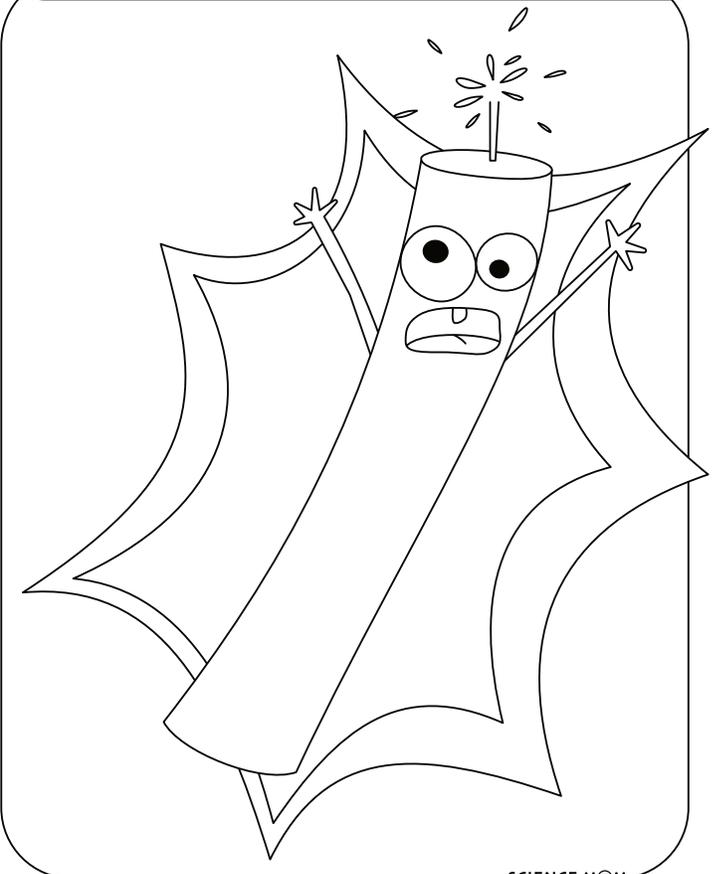

\_\_\_\_\_

FILL IN THE BLANKS USING THESE WORDS:

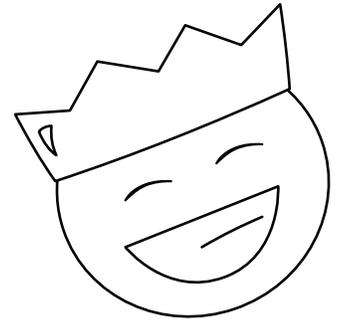

reactive	alkali	element	full
metals	halogens	periodic	bond

Your notes: \_\_\_\_\_  
 \_\_\_\_\_  
 \_\_\_\_\_  
 \_\_\_\_\_  
 \_\_\_\_\_  
 \_\_\_\_\_

AN ALMOST-FULL SHELL OF ELECTRONS IS LIKE A FIRECRACKER READY TO EXPLODE!

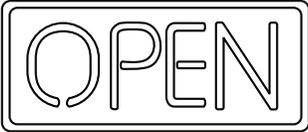

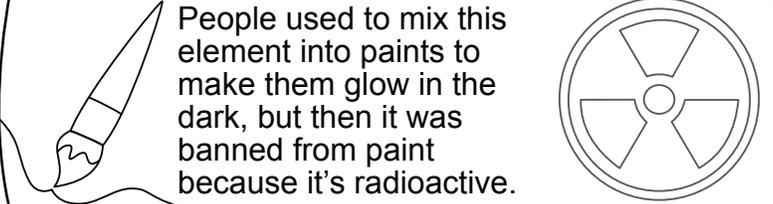

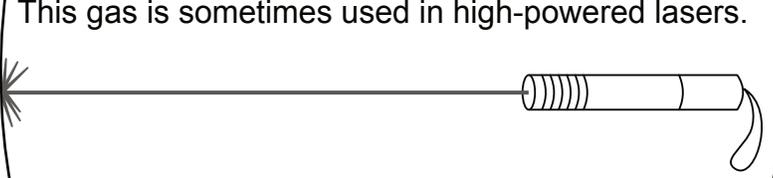

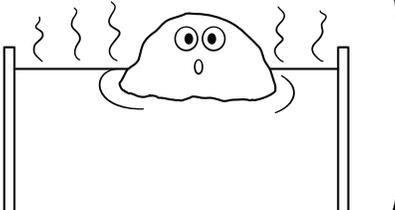

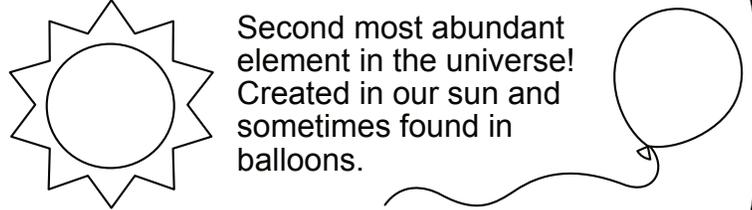

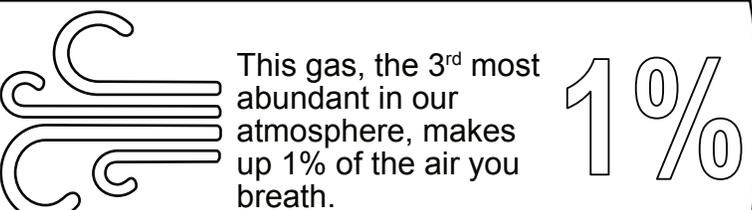

# A NOBLE Quest!

The elements in this family are called the “Noble gases.” At room temperature, they are all colorless, odorless, and tasteless. They hardly ever form bonds or react with anything! Can you draw lines to match each element with its fact box?

2	He	Helium	4
10	Ne	Neon	20.18
18	Ar	Argon	39.95
36	Kr	Krypton	83.80
54	Xe	Xenon	131.24
86	Rn	Radon	222

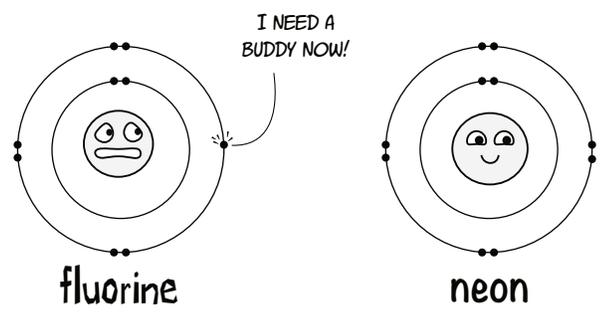

<p>When electricity passes through this colorless gas, it can glow a bright red-orange color. It's often used in signs.</p> 
<p>People used to mix this element into paints to make them glow in the dark, but then it was banned from paint because it's radioactive.</p> 
<p>This gas is sometimes used in high-powered lasers.</p> 
<p>This gas glows bright white when electricity passes through it. In its (very cold) liquid form, it's so dense that granite would float on it!</p> 
<p>Second most abundant element in the universe! Created in our sun and sometimes found in balloons.</p> 
<p>This gas, the 3<sup>rd</sup> most abundant in our atmosphere, makes up 1% of the air you breath.</p> 

# CHEMICAL BONDS

**SHARING  
ELECTRONS  
MAKES ATOMS  
HAPPY!**

Electrons really like to be in pairs. Fluorine, which is super reactive, has nine electrons, leaving one of them unpaired. Neon, a nonreactive noble gas, has ten electrons, each of them paired in different "shells" or orbitals around the nucleus.

Your notes: \_\_\_\_\_

\_\_\_\_\_

\_\_\_\_\_

\_\_\_\_\_

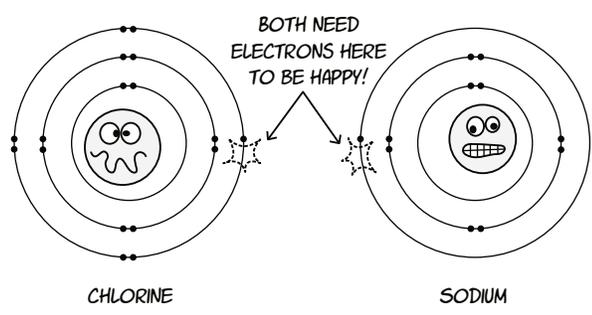

\_\_\_\_\_

\_\_\_\_\_

\_\_\_\_\_

\_\_\_\_\_

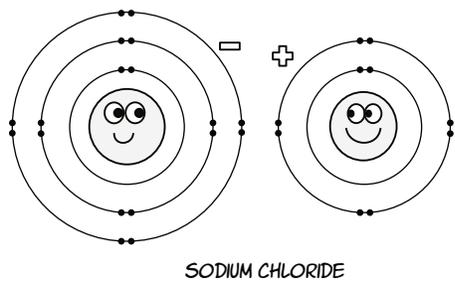

By themselves, chlorine and sodium are both "unhappy" because they have unpaired electrons.

**IONIC BOND: A CHEMICAL BOND WHERE AN ELECTRON IS TRANSFERRED FROM ONE ATOM TO ANOTHER. THIS CREATES IONS WITH OPPOSITE CHARGES. AND OPPOSITES ATTRACT!**

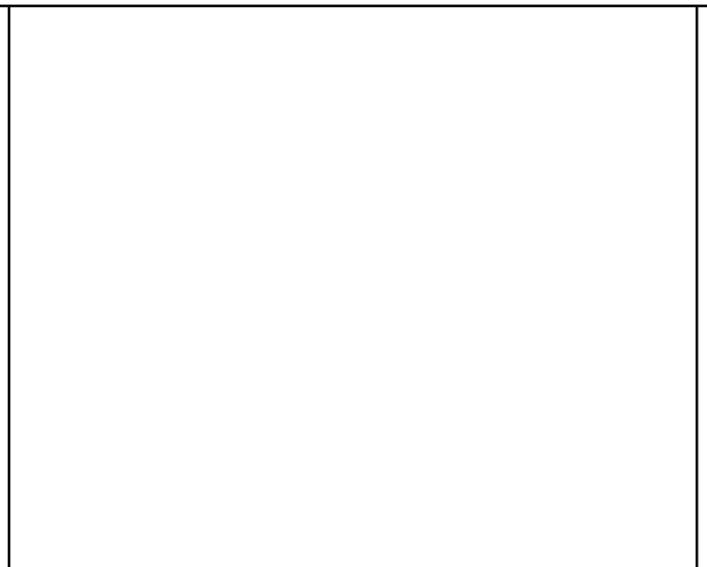

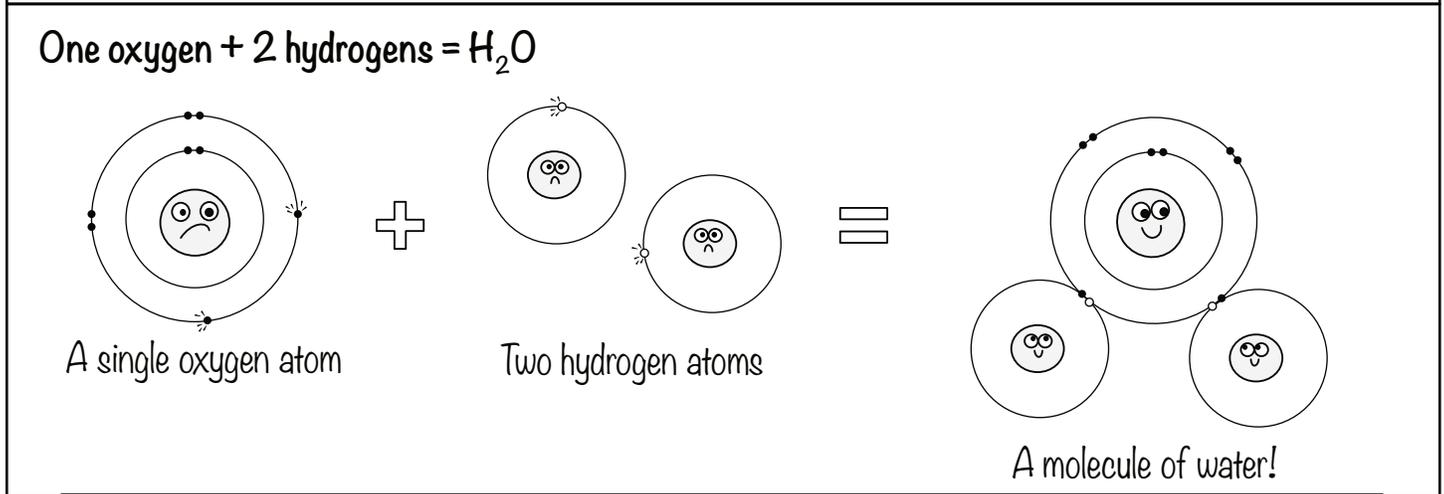

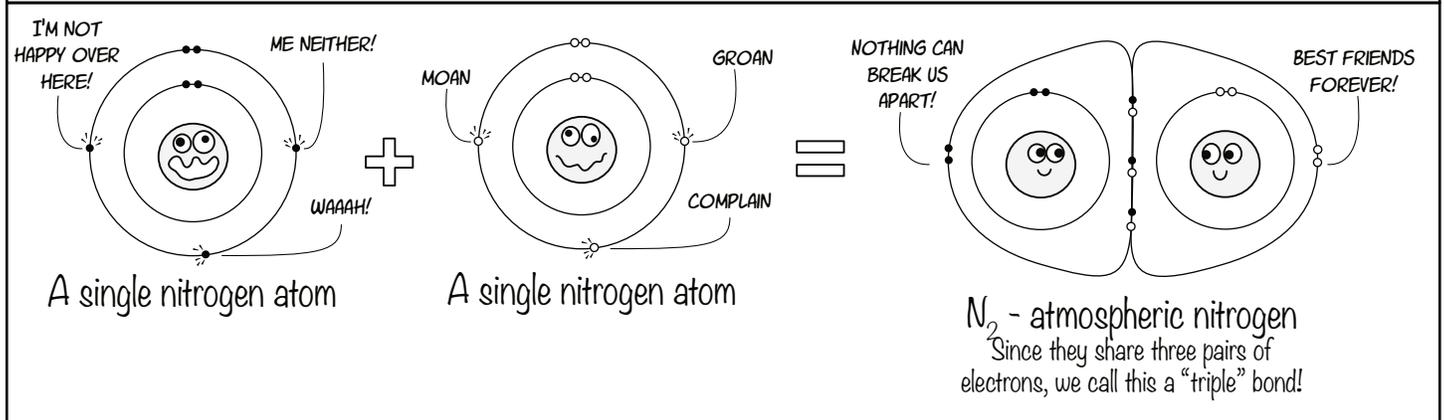

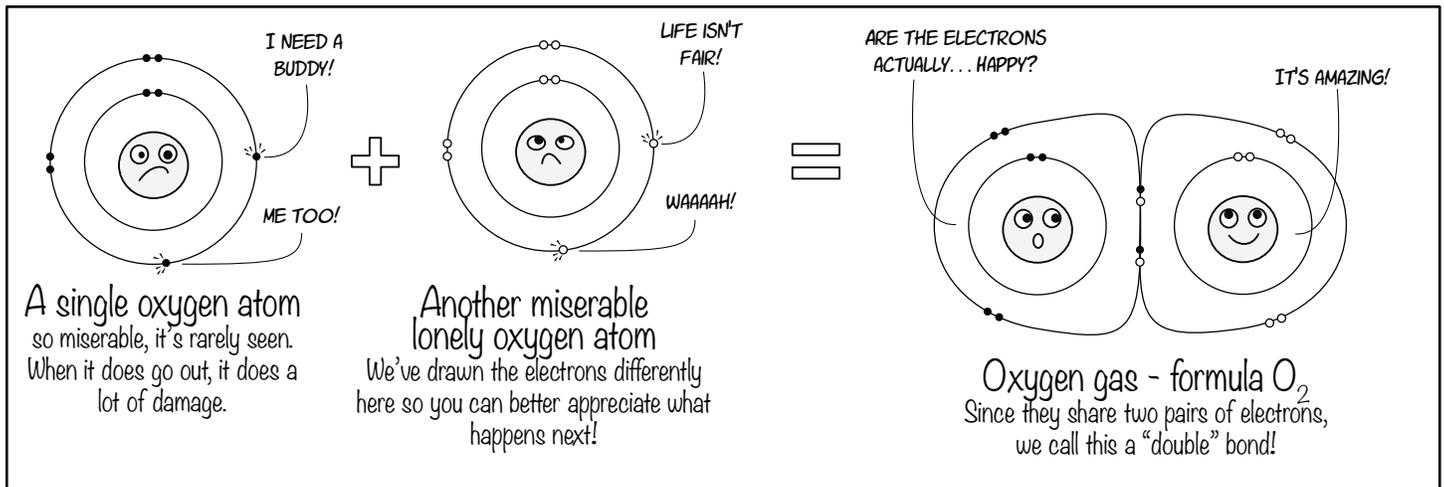

But if sodium gives its lonely electron to chlorine, then they're both happy. They've formed an ionic bond! Other atoms solve the same problem by sharing electrons.

## YOUR DOODLE SPACE

Draw your favorite moment from class or write a cool fact!

**COVALENT BOND:** A CHEMICAL BOND WHERE ELECTRONS ARE SHARED BETWEEN TWO ATOMS. SOMETIMES THE ELECTRONS ARE SHARED EQUALLY, AND OTHER TIMES ONE ATOM (WE'RE TALKING ABOUT YOU, OXYGEN!) WILL BE A BIT GREEDY.

Your notes: \_\_\_\_\_

\_\_\_\_\_

\_\_\_\_\_

\_\_\_\_\_

# Make your own Element Cards!

Choose four elements to study. Research them and draw cards for them on the blank templates on the next page (you can print more pages to make more if you'd like!) Be sure to look up the chemical symbol and atomic number of your element. Research how your element behaves at room temperature and give it a hazard rating too. Then draw an avatar. It can look like anything! Be creative and have fun designing your cards.

NAME →

# LEAD

CHEMICAL SYMBOL

Pb  
82

YOUR ELEMENT'S AVATAR! IT CAN LOOK LIKE ANYTHING YOU'D LIKE. BE CREATIVE AND HAVE FUN!

IN ITS PURE FORM, IS THIS ELEMENT COMPLETELY SAFE, MILDLY DANGEROUS, TOXIC, OR RADIOACTIVE?

**At room temp:**  
SOLID. The metal is a silvery blue color and can be either shiny or dull.

**Hazard rating:**  
Caution! Poisonous. Can cause permanent nerve and brain damage. Take care that old pipes (which contain lead) don't leach it into the water.

**Other:** Used in plumbing, bullets, and to make radiation shields. Few things are as good as lead at absorbing dangerous radiation.

IS YOUR ELEMENT A SOLID, LIQUID, OR GAS AT ROOM TEMPERATURE?

A NOTE ABOUT HOW HUMANS USE THE ELEMENT, WHERE IT'S FOUND, OR ANY OTHER COOL FACT YOU DISCOVERED.

# Hands-on Activity

## EDIBLE EXPERIMENTS - ROCK CANDY!

### MATERIALS:

CLOTHES PINS

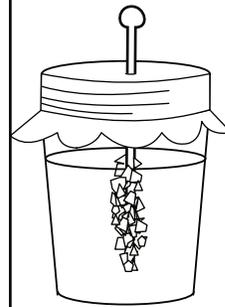

ROCK CANDY STICK,  
SKEWER OR STRING

KOOL-AID PACKETS  
(0.13 OUNCES  
UNFLAVORED)

*Don't have Kool-Aid?  
No problem! Use food  
coloring to color the crystals.*

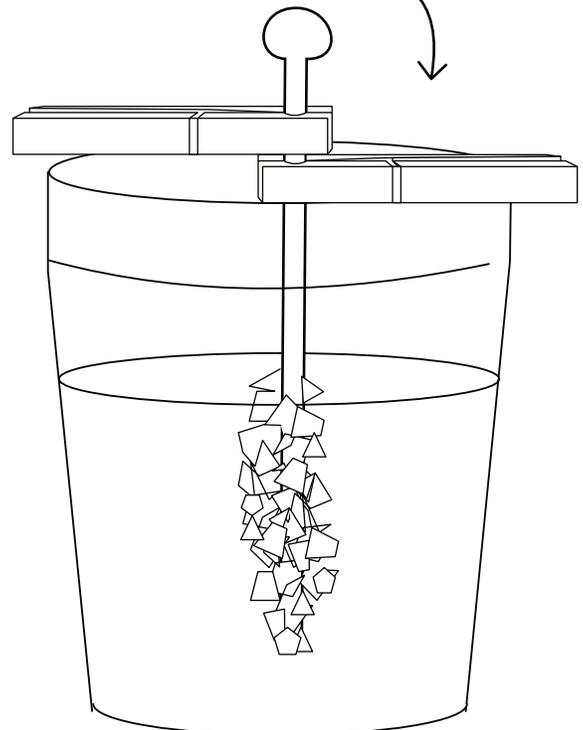

COFFEE FILTER METHOD

### ROCK CANDY

2 pint sized mason jars  
(Or other heat-proof containers)  
1 cup water  
3 ½ cups sugar  
2 Kool-Aid packets

- 1 Prepare the sticks or string by getting them wet and rolling them in dry sugar.
- 2 Bring the water to a boil, then add the sugar and stir well. Reduce the heat and continue cooking until the solution turns clear and all the sugar dissolves.
- 3 Pour the powder from one Kool-Aid packet into each mason jar.
- 4 Very carefully, pour the sugar solution into the mason jars and stir well to make sure that the Kool-Aid mixes in.
- 5 Use the clothes pins or coffee filter to suspend the stick in the center of the jar.
- 6 Let the jars sit for 2 to 8 days. Crystal formation takes time, be patient!

CLOTHES PIN METHOD

## EDIBLE EXPERIMENTS CONTINUED ...

### The science behind the treat:

When sugar dissolves into water it forms a MIXTURE - the sugar is still there and the water is still there. New molecules have NOT been formed. But the sugar molecules are attracted to the water and visa versa. When the water is HOT, it can hold more sugar than when it is cool. If you add as much sugar as the water can "carry" when it's hot, then as it cools the sugar will "come out" of the water and you'll see crystals form. If the sugar crystals grow slowly, you end up with larger crystals. If the sugar crystals grow quickly, they're smaller.

### YOUR DOODLE SPACE

*Draw your favorite moment from class or write a cool fact!*

### Troubleshooting tips:

What if there are no crystals on your stick? First, did you "seed" it by getting it wet and rolling it in dry sugar before-hand? This really helps! Second, sometimes the crystals take DAYS (up to 7 or 10) to form. If your first batch isn't working, you can try again and increase the amount of sugar (add an extra cup). The hardness of your water and measuring error can make a difference. If you don't see crystals after 14 days, probably best to try again with a fresh batch and add some extra sugar this time.

Do you think you could also make salt crystals using the same recipe? Why or why not?

---

---

---

How did your crystals turn out? Did you see a difference between the size and shape of the crystals in different jars? How long did it take before your rock candy started growing?

---

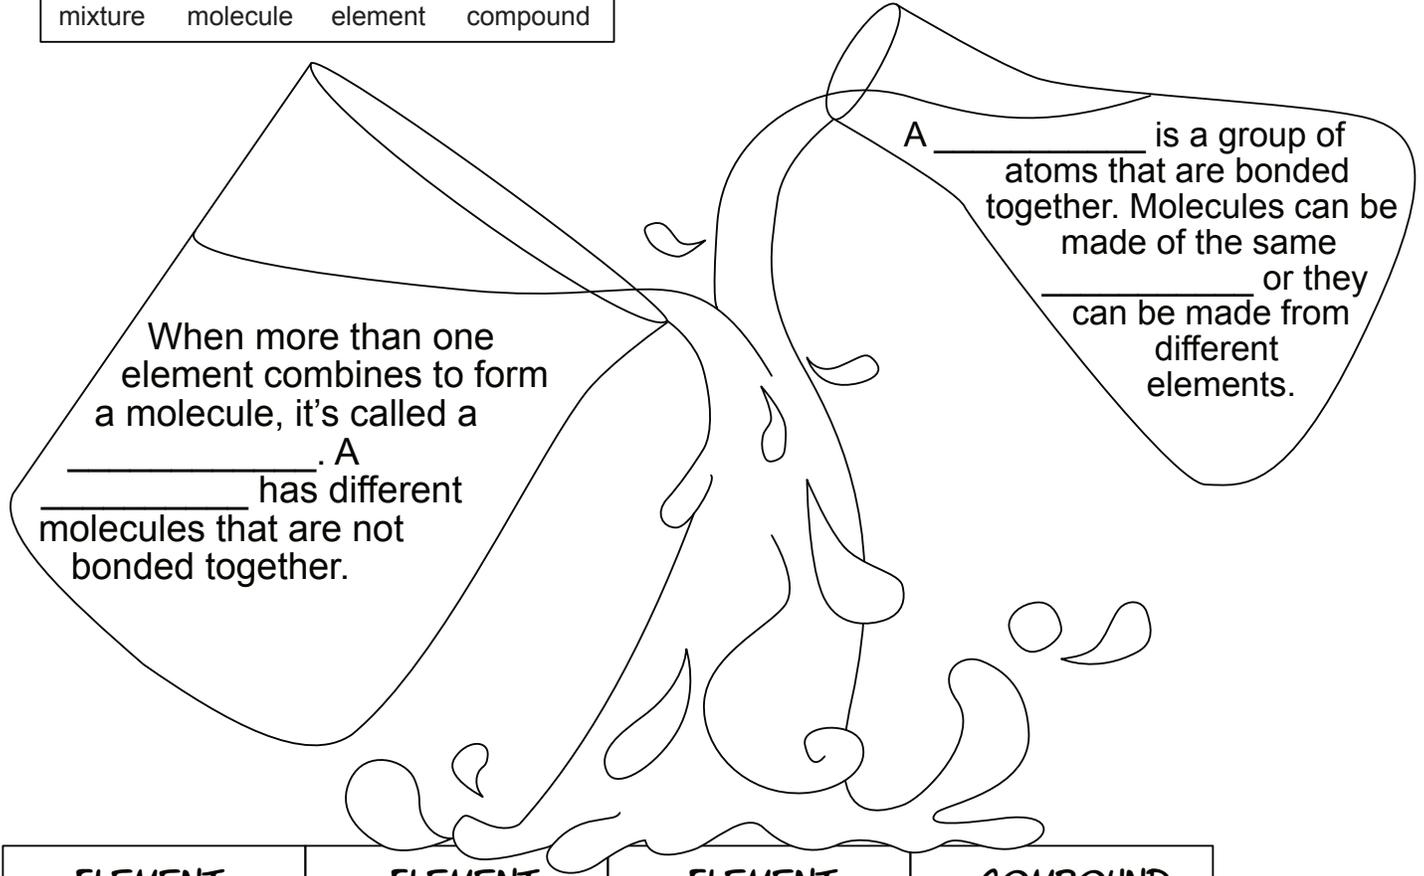

---

---

# Element vs Mixture vs Compound

FILL IN THE BLANKS USING THESE WORDS:

mixture molecule element compound

ELEMENT	ELEMENT	ELEMENT	COMPOUND

# What is RADIOACTIVITY?

Unstable atoms decay. They split apart to form new elements. You might think that an equal number of protons and neutrons would be the most stable situation, but look at this graph and you'll see that's not the case! Hydrogen is most stable with no neutrons. Larger elements, like gold, need many more neutrons than protons.

## THE STORY OF THE FIRST MEDICAL X-RAY

Dec 25, 1895, Montreal Canada

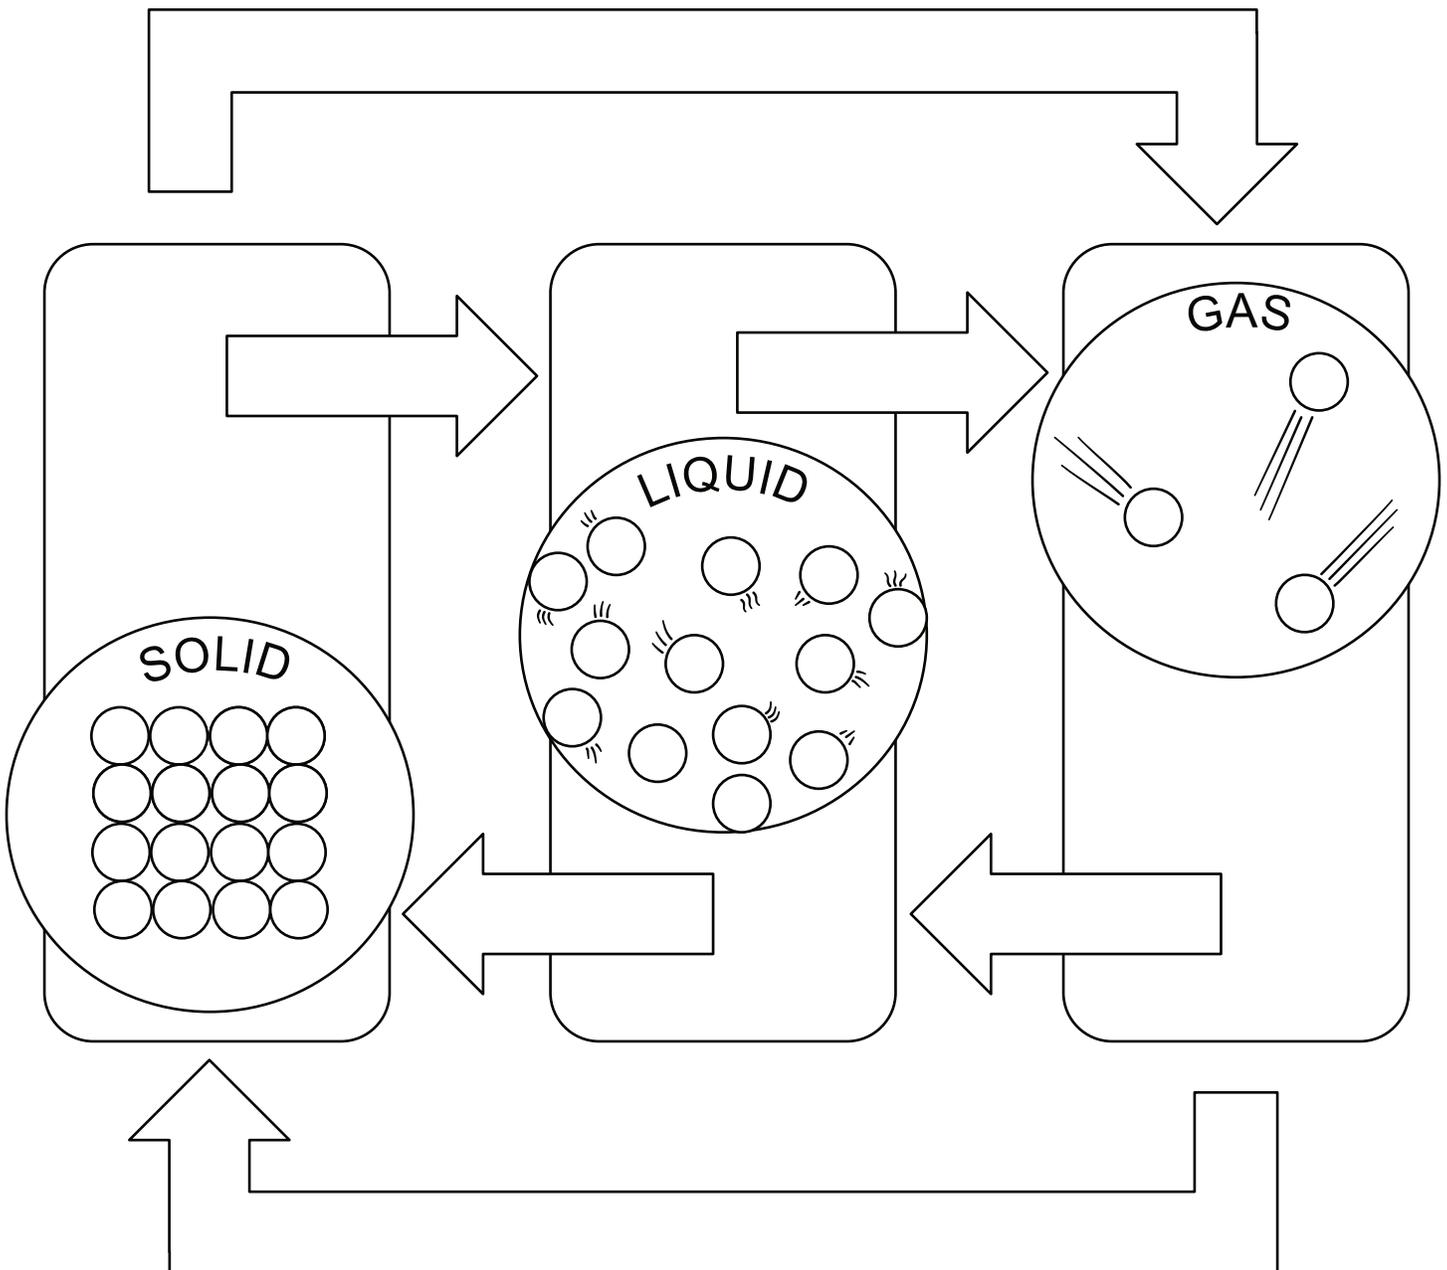

# CONSERVATION and states of matter

LABEL THE ARROWS WITH THESE WORDS:

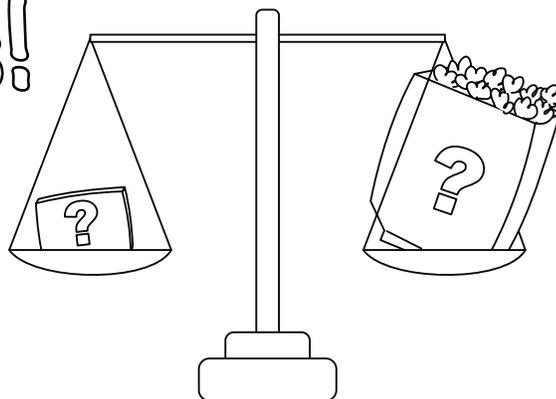

sublimation	freezing
evaporation	
melting	condensation
deposition	

Solids keep their shape and volume. Liquids take the shape of their container, but the volume will stay the same. Gasses are super flexible! They will expand to fill whatever space they are in. Usually, solids are more dense than liquids, and liquids are more dense than gasses, but there is one compound where this rule doesn't hold! Solid water is less dense than liquid water. This is why ice floats.

# Popping Predictions!

WHICH WILL WEIGH MORE? A BAG OF POPCORN THAT IS POPPED OR UNPOPPED? WRITE YOUR PREDICTION HERE:

YOU CAN TRY THIS YOURSELF BY MAKING A SCALE! ATTACH TWO UNPOPPED BAGS OF POPCORN TO EACH SIDE OF A RULER AND BALANCE IT. THEN POP ONE OF THE BAGS AND REATTACH IT. DOES THE RULER TIP MORE TO ONE SIDE OR THE OTHER? WHICH SIDE IS HEAVIER?

## YOUR DOODLE SPACE

Draw your favorite moment from class or write a cool fact!

Record the weights that Science Mom & Math Dad measure during class:

BEFORE POPPING:    AFTER POPPING:

## Baking soda + vinegar

Count how many of each atom there are in each of the boxes. Record your observations in the charts below!

$C_2H_4O_2$   
VINEGAR  
(officially called acetic acid)

+

$NaHCO_3$   
BAKING SODA  
(officially called sodium bicarbonate)

**REACTANTS**

How many sodium atoms?		
How many carbon atoms?		
How many oxygen atoms?		
How many hydrogen atoms?		

$C_2H_3NaO_2$   
SODIUM ACETATE  
(A salt)

+

$H_2O$   
WATER  
(Can officially be called "dihydrogen monoxide")

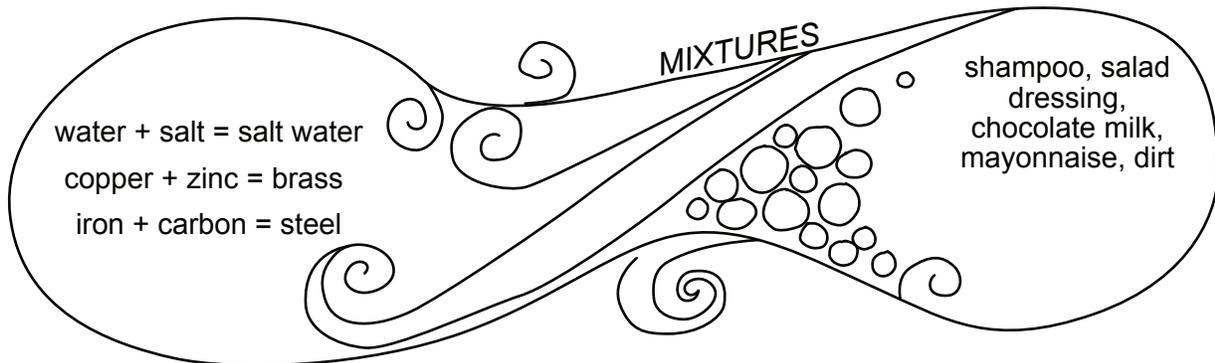

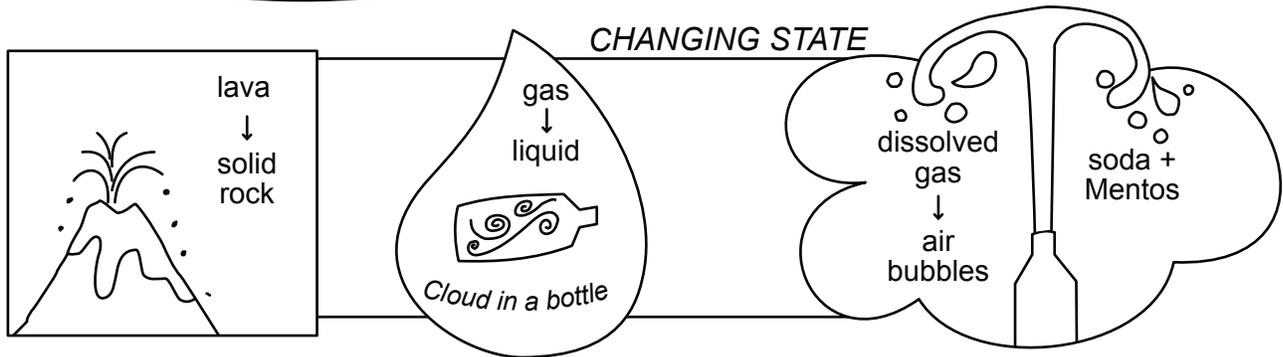

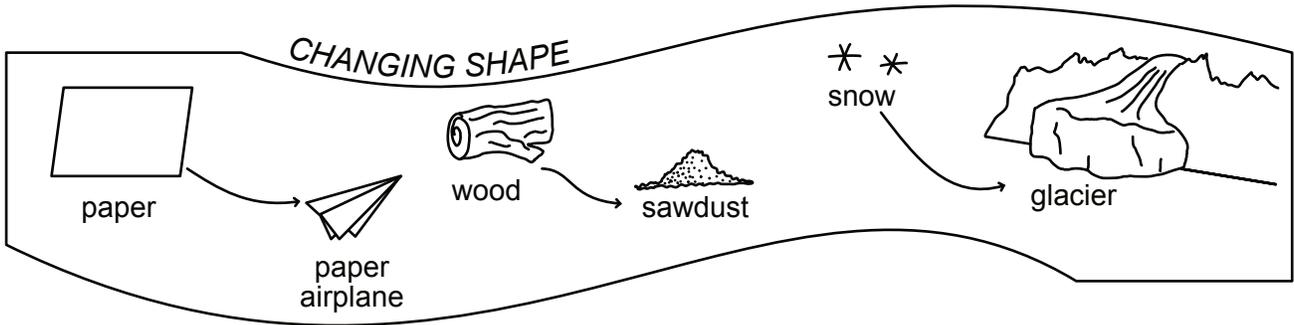

+

$CO_2$   
CARBON DIOXIDE  
(A gas! This is what makes the bubbles.)

**PRODUCTS**

How many sodium atoms?		
How many carbon atoms?		
How many oxygen atoms?		
How many hydrogen atoms?		

# Physical Changes

Your notes:

---

---

---

---

---

---

---

---

---

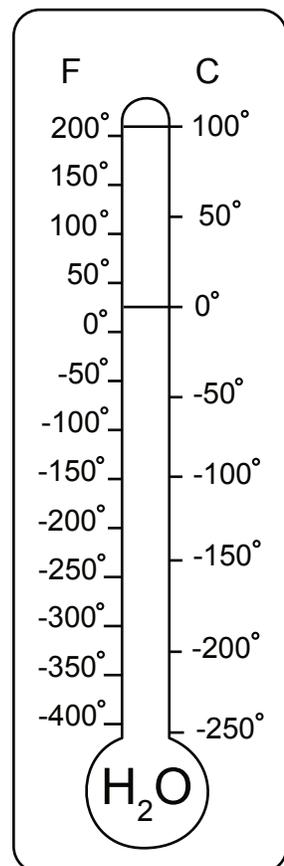

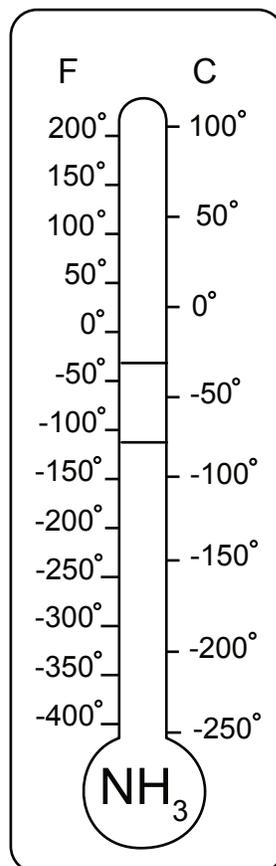

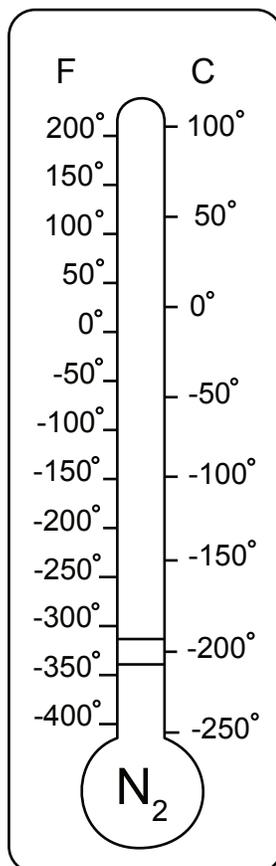

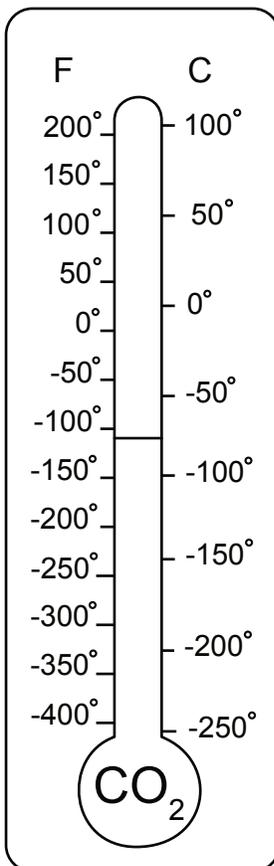

---

Liquids are rare and actually kind of weird

### YOUR DOODLE SPACE

Draw your favorite moment from class or write a cool fact!

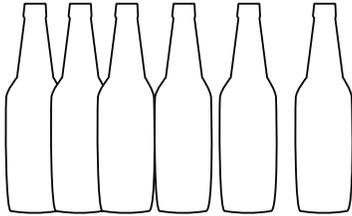

Color the thermometers to show when the substance will exist as a solid, liquid, or gas:  
(Hint:  $\text{CO}_2$  doesn't exist as a liquid on Earth unless you increase the pressure a lot!)

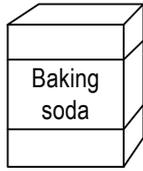

# Hands-on Activity

## MATERIALS:

6 BOTTLES OF SODA IN PLASTIC CONTAINERS WITH NARROW TOP

BAKING SODA

3 PACKAGES OF POP ROCKS CANDY

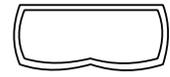

A MEASURING SPOON

A FUNNEL

6 BALLOONS

EYE PROTECTION

First, blow up each of the balloons once or twice to stretch them out, letting the air back out afterward.

*Record your observations here:*

1	Place a balloon over the top of the bottle so that it is firmly in place. Put on eye protection. Then shake the bottle and record what happens to the balloon.	
2	Use the funnel to pour 2 TBL of baking soda in the balloon. Attach the balloon securely around the mouth of the soda bottle and then tip the balloon so that the baking soda pours from the balloon into the bottle.	
3	Repeat the procedure with the Pop Rocks in a new balloon added to a new bottle of soda. Record your observations.	
4	Mix baking soda and Pop Rocks together in a new balloon and put it over a new bottle of soda. Record your observations.	
<i>With the last two bottles, experiment! You get to decide what to try:</i>		
5		
6		

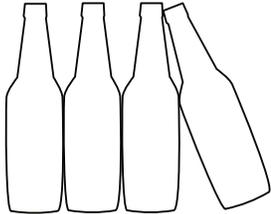

**QUESTION:** Why did the balloons expand? \_\_\_\_\_

Write your answer on another piece of paper!

# Hands-on Activity

## MATERIALS:

4 EMPTY BOTTLES

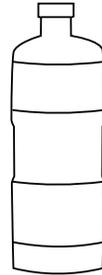

6 ALKA-SELTZER TABLETS

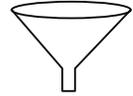

VINEGAR

WATER

OIL

A FUNNEL

FOOD COLORING

## QUESTIONS:

HOW DID THE TEMPERATURE OF THE WATER AFFECT THE LAVA LAMP? WHICH ONE WAS THE MOST DRAMATIC? WHICH LASTED THE LONGEST?

HOW DID THE VINEGAR LAMP COMPARE TO THE WATER LAMPS?

1

Pour the same amount of water into each of three of your bottles: hot water in one, room temperature water in the second, cold in the third. The level of the water should take up about  $\frac{1}{4}$  of the volume of the bottle.

2

Pour the same amount of vinegar into the fourth bottle.

3

Use your funnel to SLOWLY pour vegetable oil into all 4 bottles until they are mostly full. You may want to wait a few minutes for the oil and water to separate after this step.

4

Add 4 drops of food coloring to each bottle. Watch and observe how it interacts with the oil versus the water.

5

Break a seltzer tablet in half and add to each bottle, at the same time if possible. Watch and record your observations, especially how long the tablets took to react.

6

After all the bubbles have stopped, repeat the reaction. Record your observations and answer the questions.

7

With the final two bottles - YOU get to decide what to do! Which experiment will you try? What changes will you make?

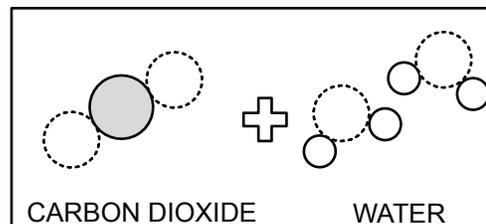

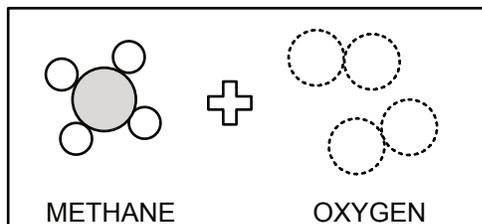

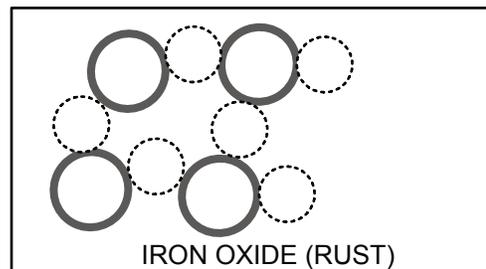

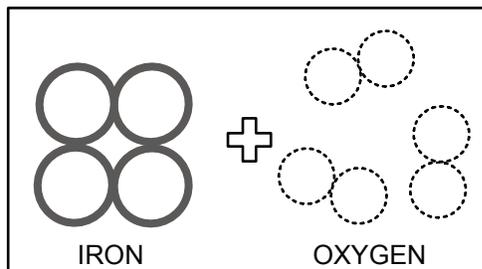

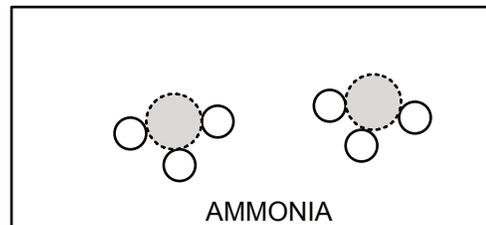

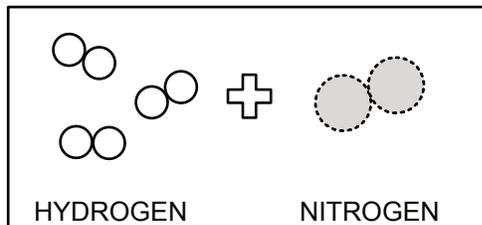

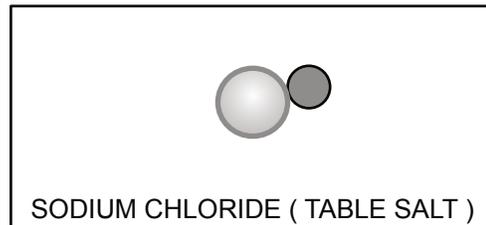

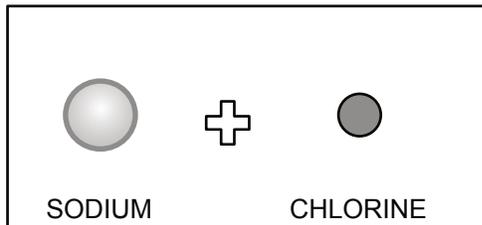

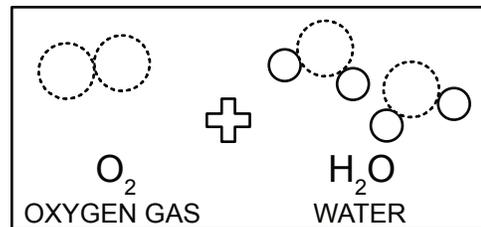

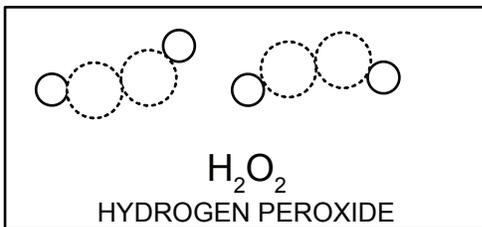

# Chemical Reactions

FILL IN THE BLANKS USING THESE WORDS:

products      chemical      reactants  
physical      molecules

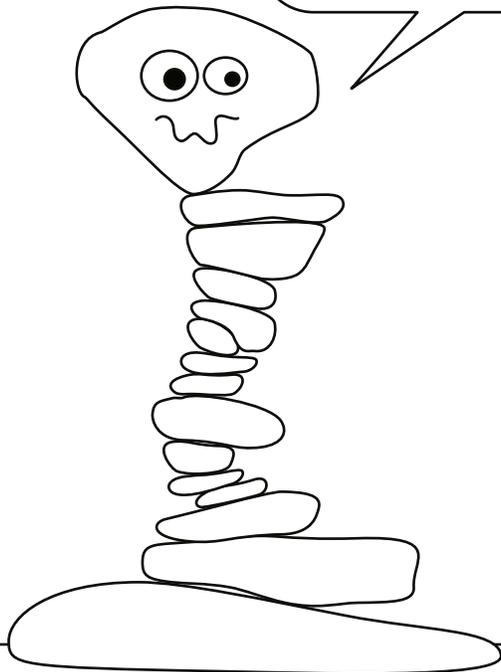

In a \_\_\_\_\_ reaction, new molecules are formed. The molecules that existed BEFORE the reaction are called the \_\_\_\_\_. The molecules that exist AFTER the reaction are called the \_\_\_\_\_.

In a \_\_\_\_\_ reaction, matter might change its shape or state, but no new \_\_\_\_\_ are formed.

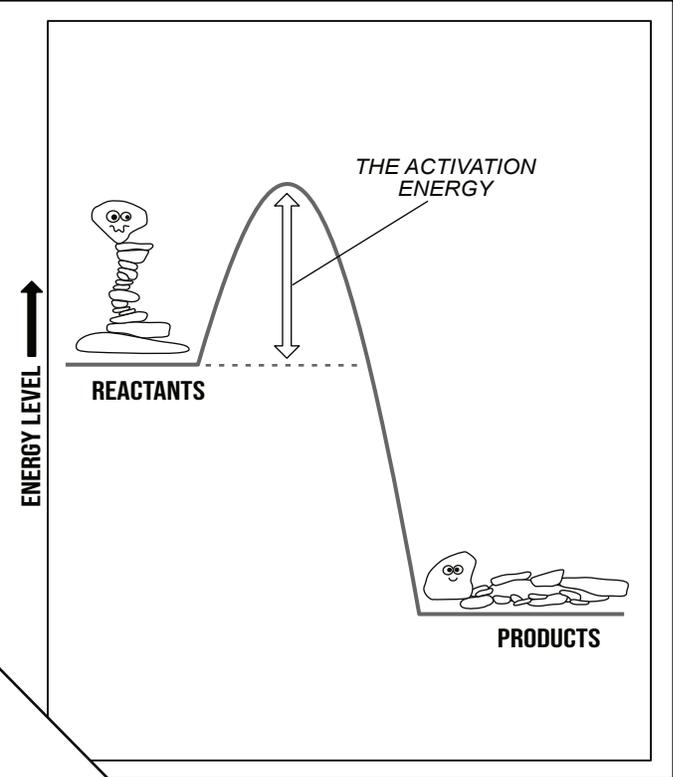

# Why do things react?

IT MIGHT SURPRISE YOU TO HEAR THIS, BUT I'M NOT ACTUALLY ALL THAT COMFORTABLE IN THIS SITUATION! I'D MUCH RATHER BE A PILE OF ROCKS ON THE GROUND.

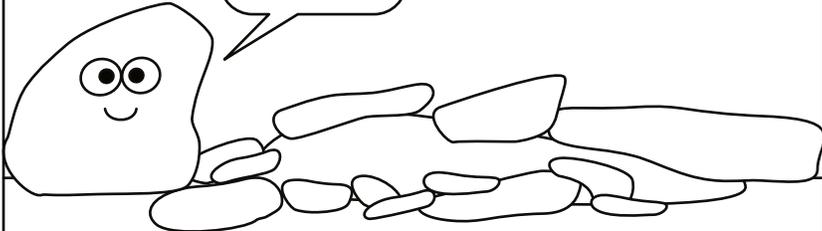

**LARGE COMPLEX MOLECULES ARE LIKE ROCK STACKS.**

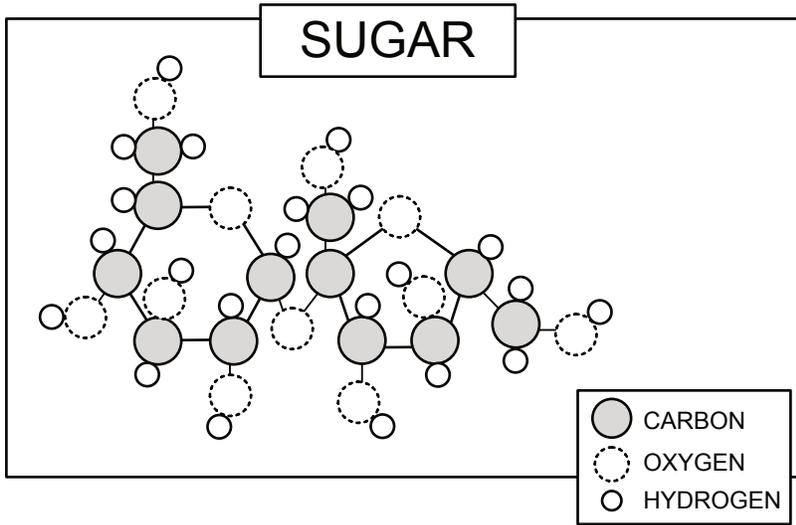

Your notes: \_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_

**SMALL SIMPLE MOLECULES ARE LIKE PILES OF ROCKS.**

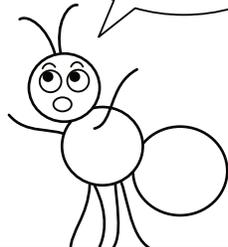

AH, THIS IS SO MUCH BETTER!

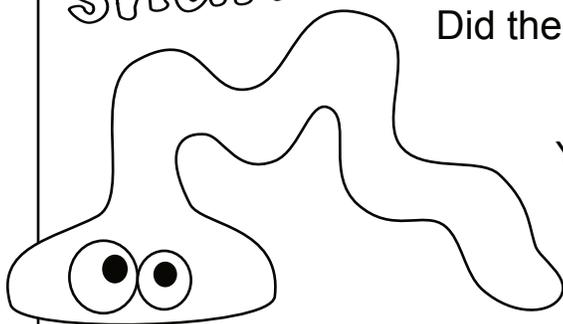

BEHOLD, THE GLORY OF A SUGAR MOLECULE!

THAT'S JUST A BUNCH OF CARBON, OXYGEN, AND HYDROGEN.

# sugar snake

What did the sugar turn into? \_\_\_\_\_

Did the reaction create heat?

YES	NO	?
-----	----	---

Your notes: \_\_\_\_\_

\_\_\_\_\_  
\_\_\_\_\_

# Iodine clock

What made the color change? \_\_\_\_\_

\_\_\_\_\_

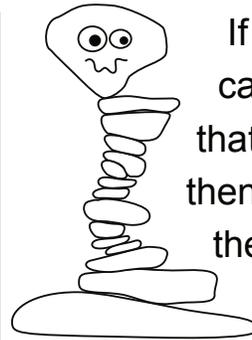

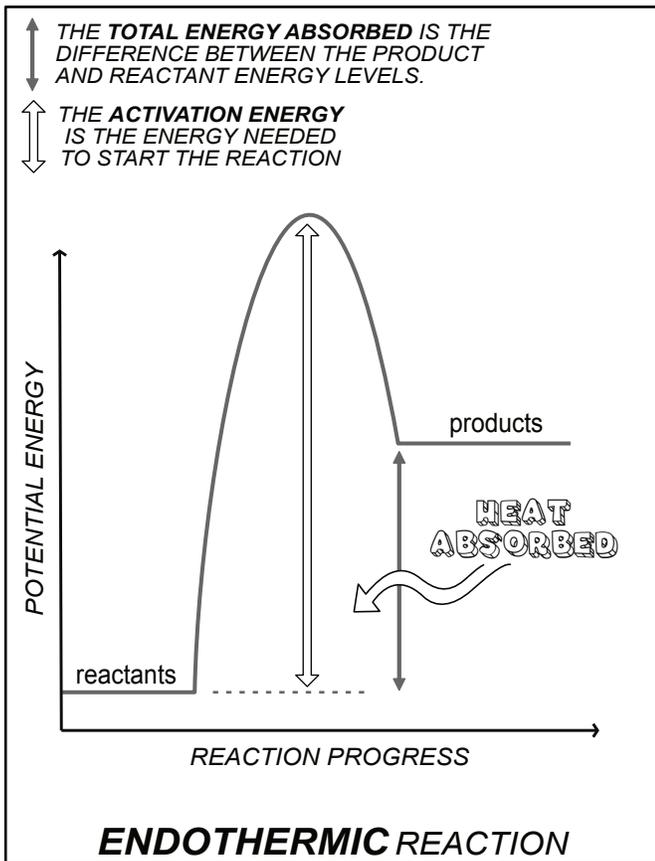

Did the reaction create heat?

YES	NO	?
-----	----	---

Your notes: \_\_\_\_\_

\_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_

# How much energy?

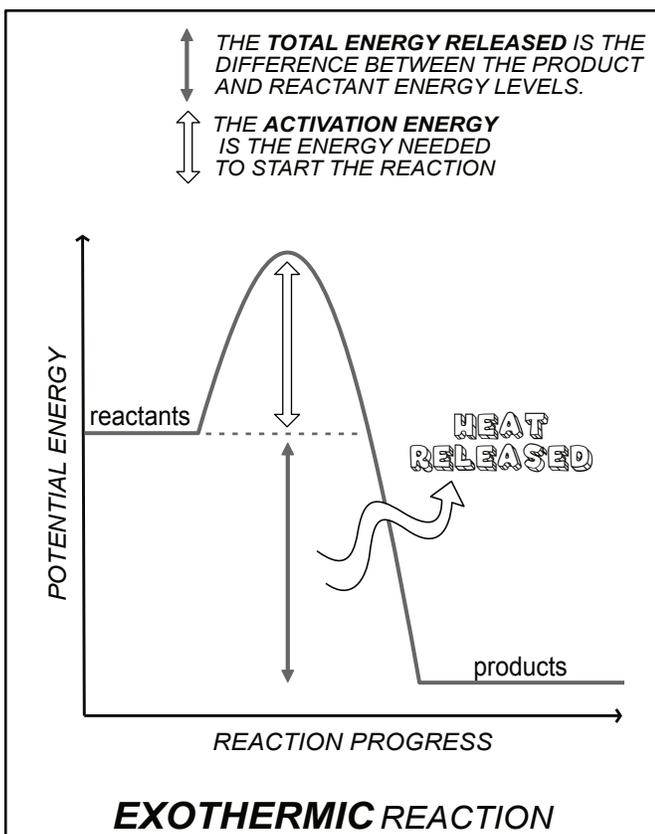

If complex molecules are like carefully balanced rock stacks that want to turn into rock heaps, then how do the stacks get built in the first place? It takes energy!

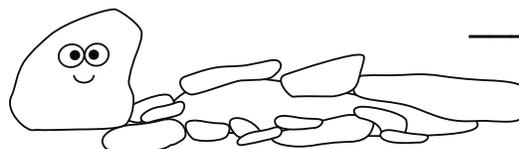

If energy is put INTO a \_\_\_\_\_ and the \_\_\_\_\_ have a **higher** energy state than the reactants, this is an \_\_\_\_\_ reaction. It **absorbs** \_\_\_\_\_. Evaporating water or dissolving ammonium chloride in water are examples of these “energy-requiring” reactions. When these reactions happen, the temperature \_\_\_\_\_!

FILL IN THE BLANKS USING THESE WORDS:

rises	reaction	drops	energy
products	endothermic	determines	
reactants	exothermic	releases	

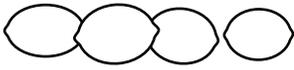

If a reaction PRODUCES energy, and the products have a **lower** energy state than the \_\_\_\_\_, this is an \_\_\_\_\_ reaction. It \_\_\_\_\_ energy. A burning match and rusting metal are examples of these “energy-producing” reactions. When these reactions happen, the temperature \_\_\_\_\_!

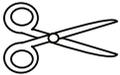

# Hands-on Activity

## LEMON BATTERY

### MATERIALS:

LEMONS (OR POTATOES, OR VINEGAR IN AN ICE CUBE TRAY)

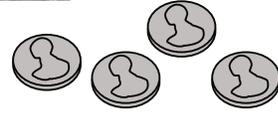

SCISSORS OR KNIFE TO MAKE HOLES IN THE LEMON OR POTATO

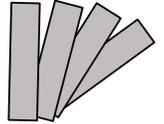

ALLIGATOR CLIPS OR COPPER WIRE

LED DIODE

ONE COPPER PENNY PER LEMON OR ONE PIECE OF COPPER FROM A LEMON BATTERY SCIENCE KIT

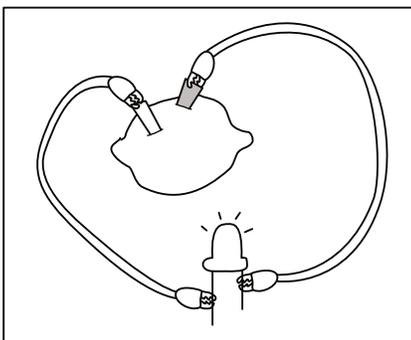

ONE GALVANIZED NAIL PER LEMON OR ONE PIECE OF ZINC FROM A LEMON BATTERY SCIENCE KIT

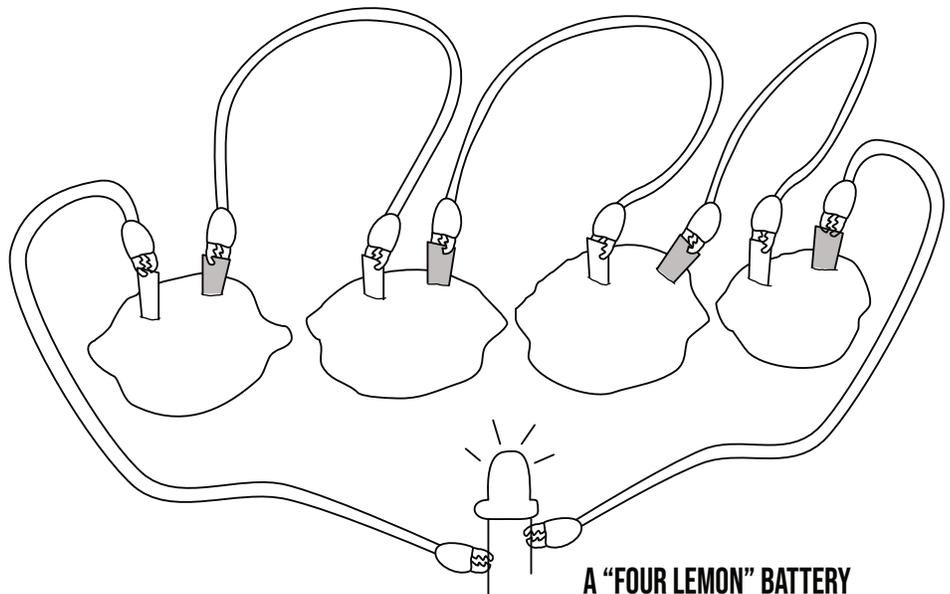

### INSTRUCTIONS:

Prepare two lemons or more (The more you have the stronger your battery is. For getting an LED light to light up, we recommend at least two. Potatoes or vinegar in an ice cube tray can be used instead of lemons.)

- 1 Squeeze and roll the lemons for several minutes. The individual segments of the lemon need to break up enough that a current can run from one end to the other.
- 2 Make two slits on either side of the lemon and insert the penny or copper into one slit and the galvanized nail or zinc into the other. Make sure that enough of the metal is sticking out of the lemon that you'll be able to attach the alligator clips or wire. Repeat with the remaining lemons.
- 3 To build the circuit between the lemons, attach one alligator clip around the zinc from the first lemon and connect it to the copper in the next lemon. If using multiple lemons, continue this pattern with each of the lemons.

A "SINGLE LEMON" BATTERY

A "FOUR LEMON" BATTERY

CONTINUED ON NEXT PAGE:

# LEMON BATTERY CONTINUED

For electricity to flow through the wires, the circuit needs to form a loop. If you connect the copper in the first lemon to the zinc in the last lemon, then you will have an electric current flowing through the wires - but this current is so small you won't be able to feel it or see it.

4 Attach the ends to the LED light or clock you are trying to power. Touch the wire attached to the first penny or copper to the **long leg** of your LED light. Simultaneously touch the wire attached to the nail of the last lemon to the short leg of the LED light. If you need help differentiating the long leg from the short look for a "flat spot" on the bottom edge of light. That is where you will find the short leg.

If your first attempt doesn't work, try adjusting the number of lemons or vinegar cells you are using.

What happens if you try powering the light with 1 lemon versus 2?

---

---

What would happen if you had attached the copper wire from one penny to another penny and one nail to another nail instead of following the coin-nail-coin-nail pattern?

---

---

---

What else do you think would serve as a good materials for this experiment? Are there any other conductors (the alligator clips or copper wire) or electron sources (copper and zinc) that you could use?

---

---

---

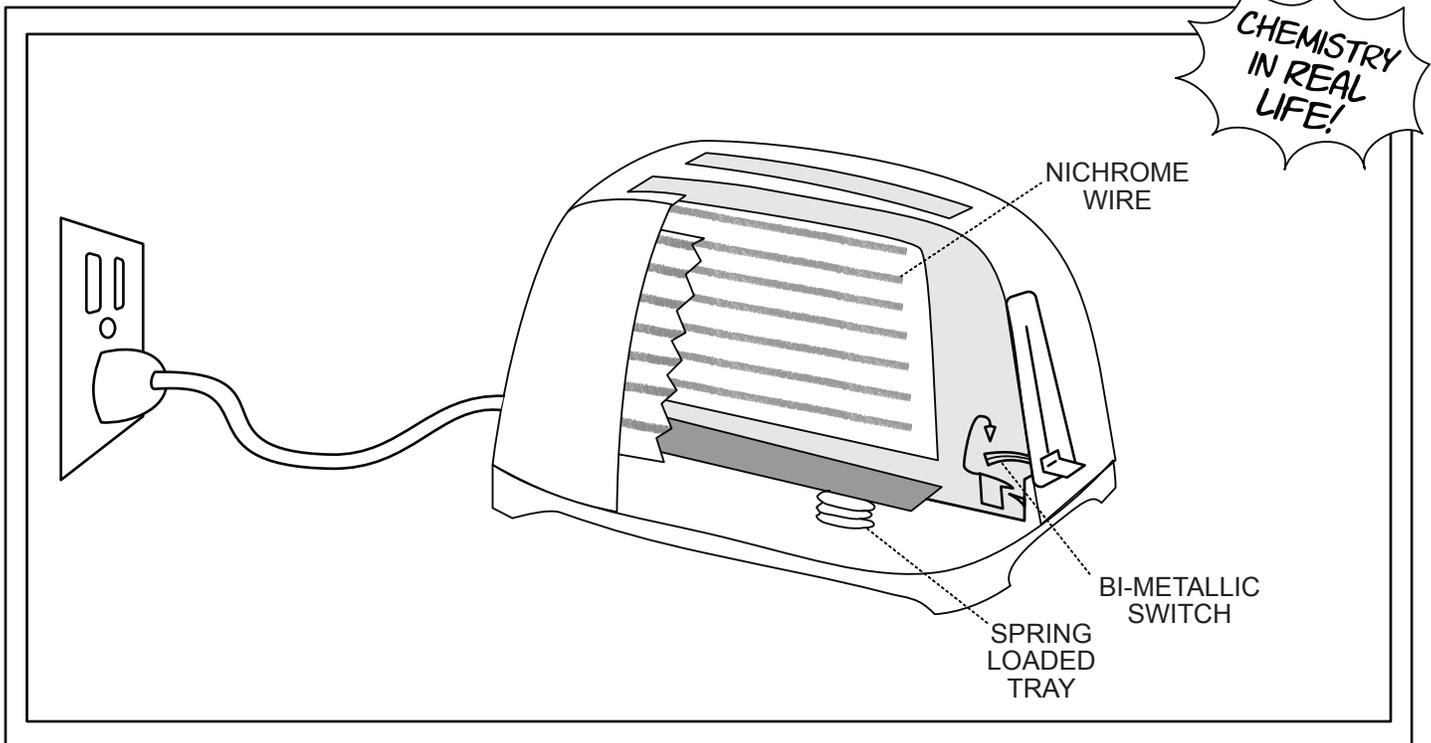

Sometimes it can be tricky to get a lemon battery to work. Did you run into any trouble with your experiment? If so, what did you try?

---

---

---

# HOW a TOASTER works

FILL IN THE BLANKS USING THESE WORDS:

light      heat      glow      chemical      sugars  
filaments      energy      reactions      proteins

When the toaster is turned on, \_\_\_\_\_ passes from the outlet to the toaster in the form of electricity. The electric current passes through thin \_\_\_\_\_ that are uniformly spaced around the toaster slot. The filaments are specially designed to \_\_\_\_\_ up when electricity passes through them. They get so hot that they \_\_\_\_\_ bright red! The electrical energy has been converted into heat and \_\_\_\_\_. The steady supply of heat causes \_\_\_\_\_ to happen on the surface of the bread. The heat causes \_\_\_\_\_ and \_\_\_\_\_ to combine together, forming new molecules that change the color and flavor of the bread, turning it into delicious toast.

Your notes: \_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_

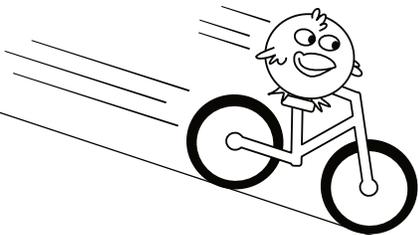

# ENERGY

## YOUR DOODLE SPACE

Draw your favorite moment from class or write a cool fact!

Chemical reactions can create electricity (this is how batteries work!), light and heat, sound (think fireworks), and movement too. The **LAW OF CONSERVATION** tells us that energy cannot be created or destroyed, instead it's transferred from one form to another.

**MOVEMENT** IF IT'S MOVING, THAT'S KINETIC ENERGY. IF IT COULD MOVE LATER, THAT'S POTENTIAL ENERGY.

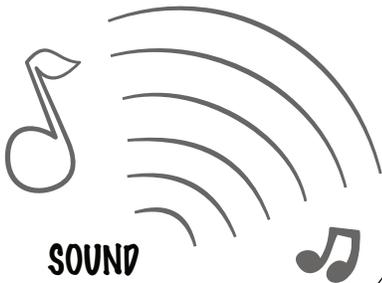

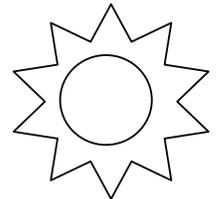

**ELECTRICAL** THE FLOW OF ELECTRONS!

**LIGHT and ELECTROMAGNETIC RADIATION**

MADE OF PHOTONS! LITTLE PARTICLES OF ENERGY THAT MOVE SUPER FAST.

**SOUND**

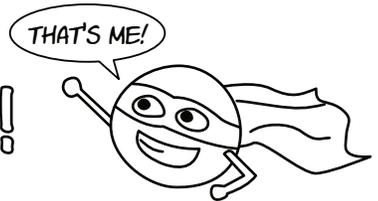

VIBRATIONS! MUST TRAVEL THROUGH MATTER. CANNOT TRAVEL THROUGH EMPTY SPACE.

**THERMAL (HEAT)**

WHEN MOLECULES MOVE FASTER THEY HAVE MORE ENERGY

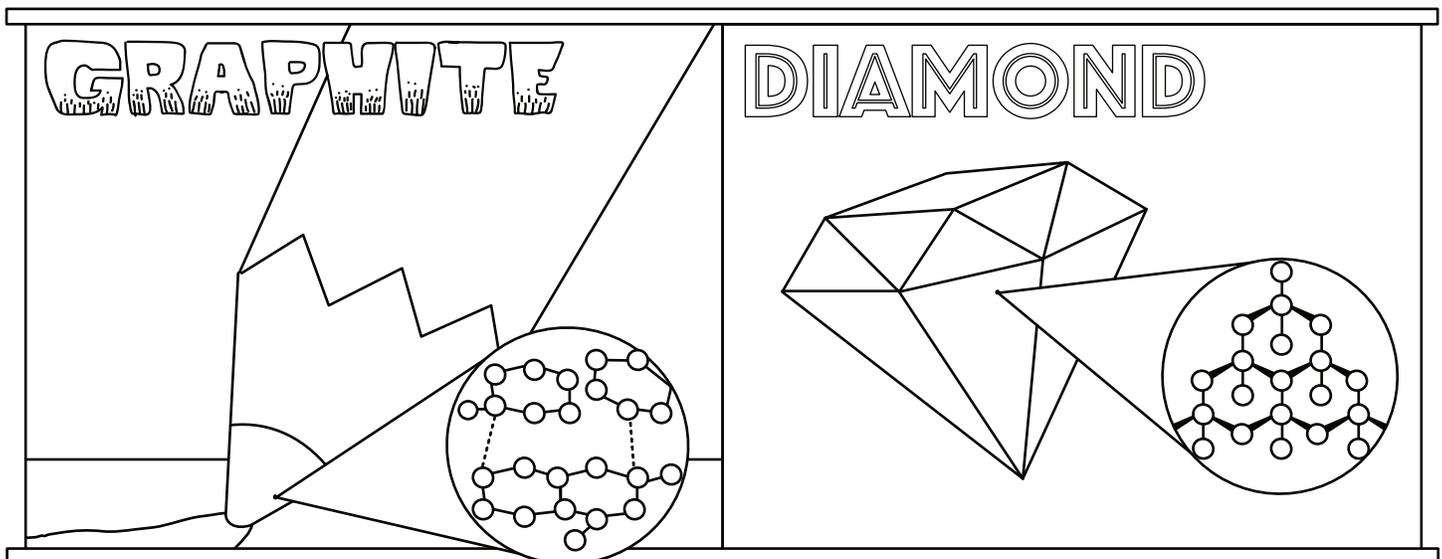

# CARBON THE BUILDING BLOCK OF LIFE!

FILL IN THE BLANKS USING THESE WORDS:

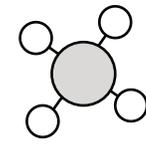

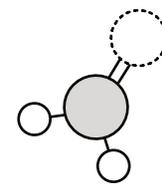

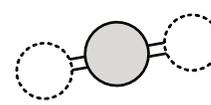

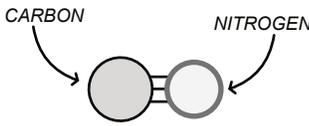

oxygen backbone electrons graphite  
four abundant unpaired carbon

Carbon is the second most \_\_\_\_\_ element in the human body. (The most abundant element is \_\_\_\_\_.) It's the \_\_\_\_\_ of all the molecules that cells are made of. Because it has four \_\_\_\_\_ that are \_\_\_\_\_, carbon likes to form \_\_\_\_\_ bonds with other atoms. Soft black pencil lead called \_\_\_\_\_ is made of carbon. The hard clear crystal of a diamond is made of \_\_\_\_\_ too.

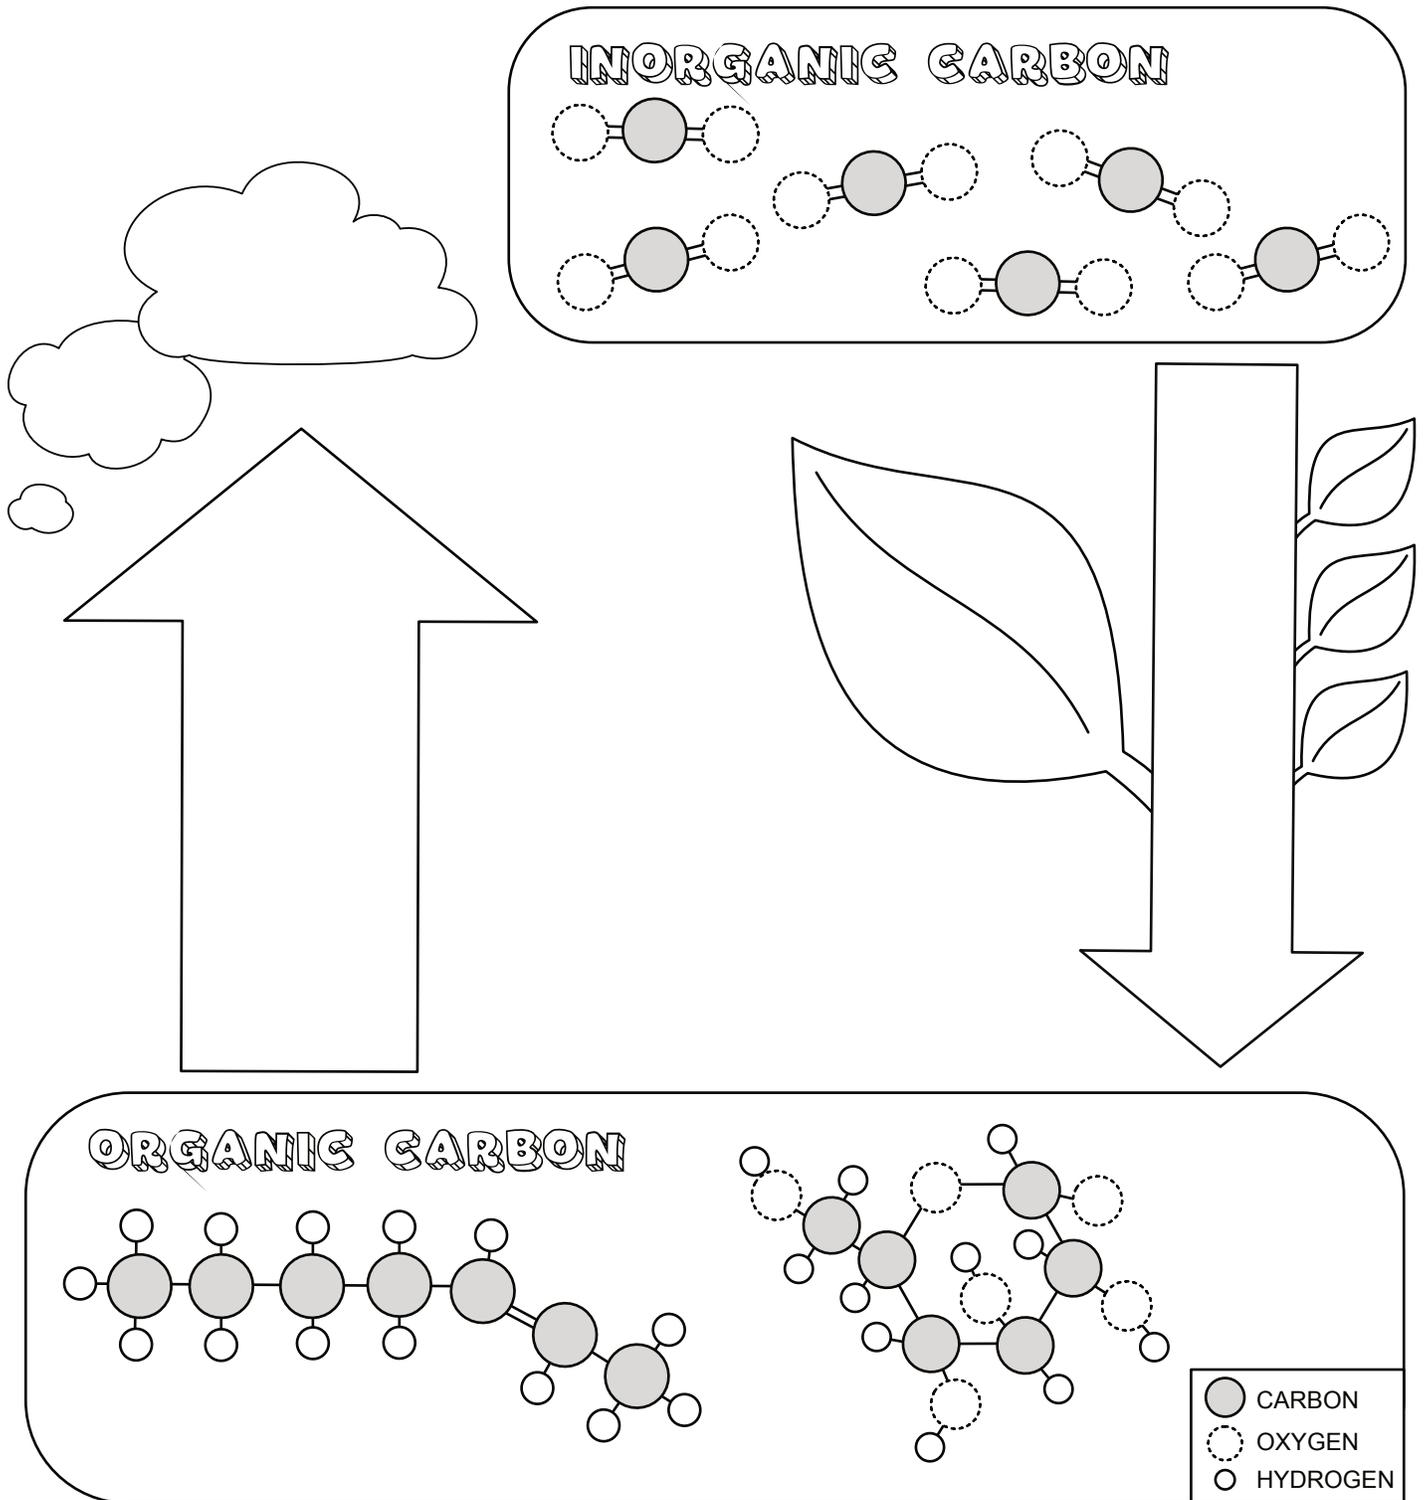

**YOUR DOODLE SPACE**  
Draw your favorite moment from class or write a cool fact!

CARBON LIKES TO FORM 4 BONDS:

 <p>4 single bonds</p>	 <p>1 double &amp; 2 single</p>
 <p>2 double bonds</p>	<p>But sometimes it only has three bonds:</p>  <p>CARBON NITROGEN</p> <p>LOOK OUT! THAT'S CYANIDE, WHICH IS VERY POISONOUS.</p>

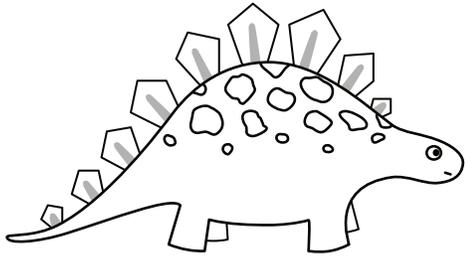

# The Carbon Cycle

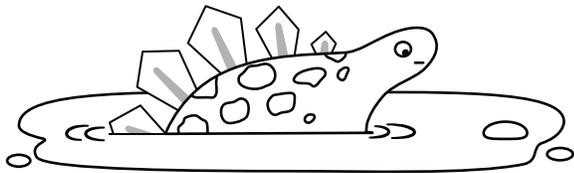

Carbon really just has two forms: carbon dioxide (inorganic) and everything else (organic). When organic carbon is eaten or burned, energy is released and the carbon is converted into carbon dioxide. When algae or plants perform photosynthesis, carbon dioxide is converted back into an organic form. The same carbon atoms can travel in a huge circle from gas to organic matter to gas and back again. This is called the carbon cycle.

# WHAT'S A FOSSIL FUEL?

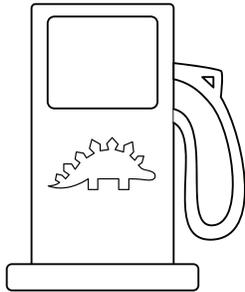

## STATES OF DINO-MATTER

SOLID

LIQUID

GAS

You've probably seen jokes that credit dinosaurs as the source of gasoline, but this isn't quite accurate. Fossil fuels like petroleum, oil, and natural gas come from organic matter that lived during the Carboniferous period, which occurred several million years before the first dinosaurs walked on Earth. The carbon in gasoline once existed in plants, algae, invertebrates, and fish, but not dinosaurs.

*How long will fossil fuels last?*

*The answer is 50 years or forever, depending on who you ask.*

*On this thing more people agree: the more fuel we burn, the warmer the planet becomes.*

## YOUR DOODLE SPACE

*Draw your favorite moment from class or write a cool fact!*

*During the Carboniferous period, fungi hadn't yet developed the ability to break down cellulose, the main ingredient of wood. Without these decomposers, an enormous amount of plant material accumulated.*

# ROCK LAYERS

## KEY

Fish

Ammonite

Shell

Dinosaur

Plant

Trilobite

Bird

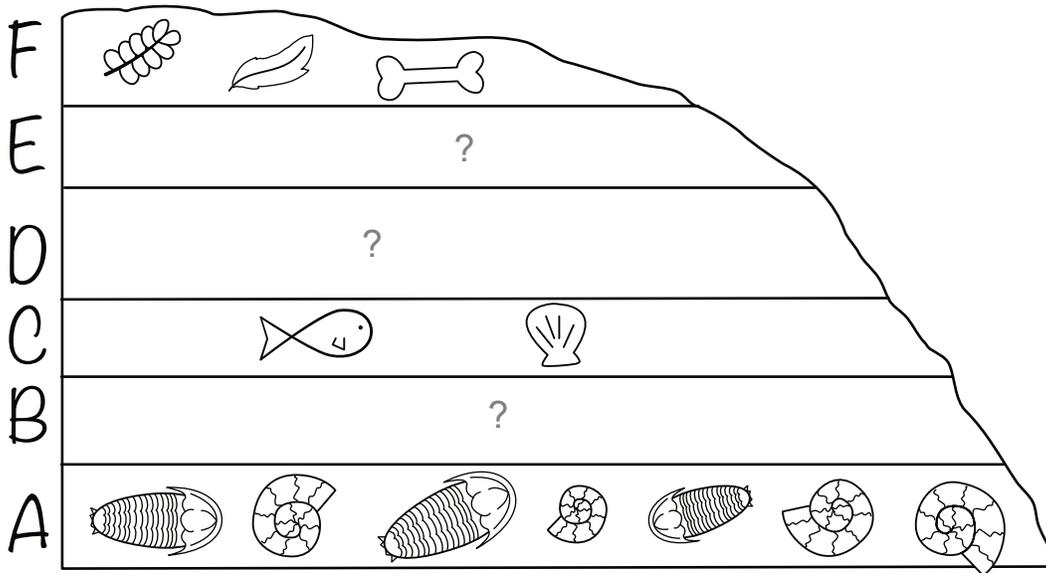

Mammal

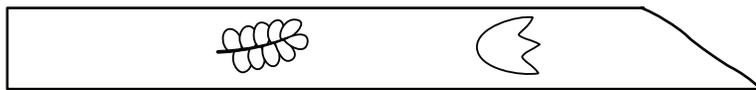

You have joined a team of stratigraphers and paleontologists who are studying the layers of rock and fossils of this site!

Your job is to complete the timeline and rock layer chart by studying the information available. What do the fossils in each layer tell you about each period of time? According to the timeline, what fossils would you find in each missing layer?

Cut out the rock layers and timeline boxes below. Can you paste them over the correct question marks?

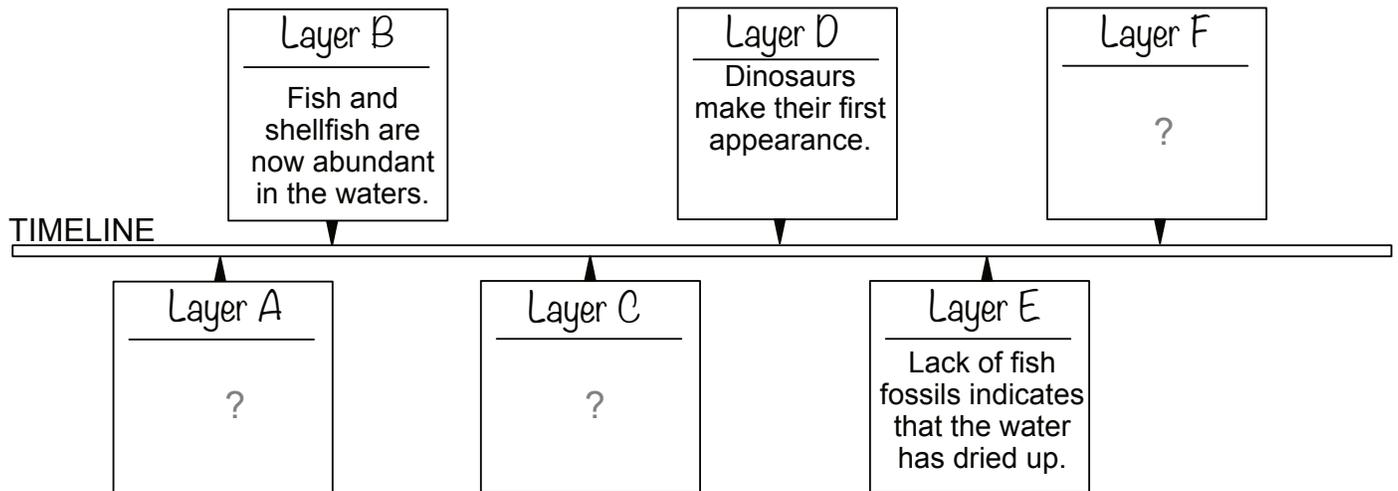

Ammonites and trilobites are abundant in the shallow waters.

Mammals and birds live in the area.

Ammonites and trilobites have gone extinct.

# ROCK LAYERS continued...

Which is the oldest layer? \_\_\_\_\_

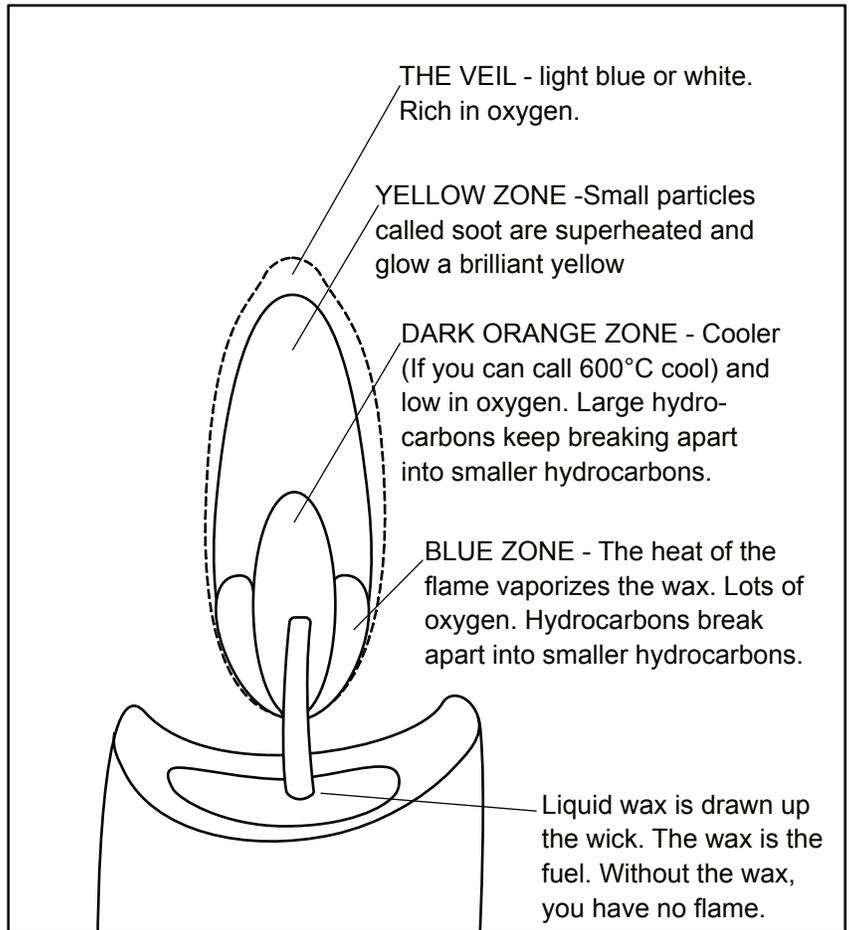

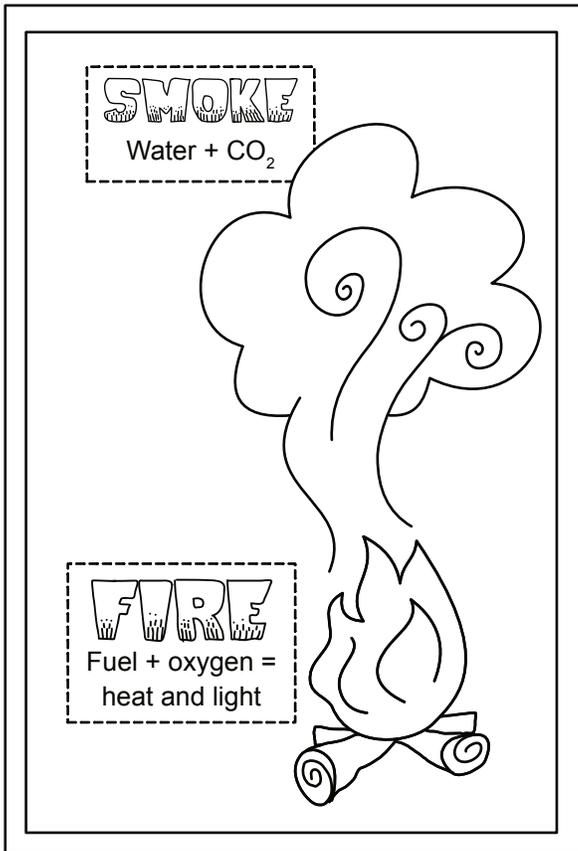

What layers indicate that water was present? What evidence do you have to support this?

Why weren't mammal bones found in layer B?

Cut out the rock layers and timeline boxes on the other side of this paper and see if you can match them over the correct question marks!

# What is FIRE? All about combustion

FILL IN THE BLANKS USING THESE WORDS:

oxygen	combustion	water
hydrocarbons	carbon	

Fire is the result of a chemical reaction called \_\_\_\_\_. Three things must be present for fire: \_\_\_\_\_, fuel, and heat. When a fuel like wood meets oxygen, the \_\_\_\_\_ in the wood combine with oxygen to form \_\_\_\_\_ dioxide and \_\_\_\_\_. Water is one of the main ingredients of smoke. It is also the main ingredient of clouds. If a forest fire gets large enough, it can produce a pyrocumulus cloud: a cloud so big that it makes rain and lightning.

Your notes: \_\_\_\_\_

\_\_\_\_\_

\_\_\_\_\_

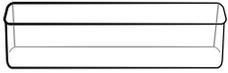

\_\_\_\_\_

\_\_\_\_\_

# Hands-on Activity

## BUILD A LEVEE

### MATERIALS:

TUPPERWARE OR GLASS CONTAINER

WATER

FINE-GRAINED BUILDING MATERIAL (SUCH AS 1 CUP FLOUR MIXED WITH 1 TBSP COCOA POWDER)

DUCT TAPE OR ELECTRICAL TAPE

PLASTIC BAG

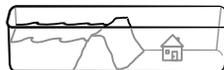

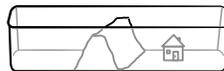

COARSE-GRAINED BUILDING MATERIAL SUCH AS NUTS, DRIED BEANS, OR DRIED FRUIT.

(OPTIONAL) SMALL TOYS TO REPRESENT THE TOWN

### INSTRUCTIONS:

- 1 First, arrange a small pile of "large particle size" material in the center of your Tupperware container. Slowly pour in 1/2 cup of water on one side of your levee and observe what happens. Does the water stay on one side of the levee or does it leak through to the other side?
- 2 Next, prepare your "small particle size" material. If using flour and cocoa powder, mix one cup of flour with 1 tbsp of cocoa powder and 1/2 cup hot water. Add the water slowly and mix well, kneading it into a stiff dough.
- 3 Form half of your dough into a levee and arrange some small objects on the other side to represent the town. If desired, you can press some of the large particle-size material into the sides of the levee to reinforce it.
- 4 Slowly pour water on the side of the Tupperware that is opposite of your town and observe. It should be keeping all the flood waters away from the town!
- 5 Make your levee fail. You could create a small hole with a toothpick, or keep adding water until the water pours over the top.
- 6 Dry out your container and use the other half of the dough to make a new levee!

### A FEW FACTS ABOUT LEVEES

A levy is more than a big pile of dirt, although at first glance that's pretty much what it looks like!

For a levy to work well, it has to be made out of the right material and have the correct slope. In general, finer materials such as clay and silt will do a better job of holding back water than coarse materials like sand, gravel, or rocks.

There are two main ways that levies can fail: one is by being overtopped (the water flows over the top of the levee and then begins to erode it) The other is by breaching (basically a hole forms in the levee and then a big portion of it breaks). Before a levee breaches, there will often be a "sand boil." Water will begin flowing through a weaker spot in the levee and out the other side.

If you live in the United States, you might think that cities along the Mississippi River are the only ones that have levies. But there are levies in all 50 states and more than 40% of the US population lives in a county with at least one levee. When they work, we hardly notice them. When they fail, the flooding can be catastrophic.

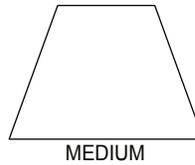

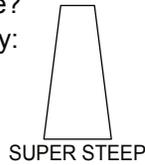

**BUILD A LEVEE CONTINUED...**

Would your flour levee hold the water back indefinitely/forever or would the water eventually leak through?  
What could you do to make this levee stronger?

---

---

Which slope would make the strongest levee?  
Super steep, medium, or broad? Explain why:

---

---

---

Pretend you are in charge of building two real-life levees, what are some different considerations to take into account for designing an urban vs rural levee? Would you need to do anything differently for the urban levee (protects a city area with stores, houses, and other buildings) versus an agricultural levee (protects fields)?

---

---

---

---

What are some other natural earth process that affect humans? What kind of designs and solutions have we come up with to cope with them?

---

---

---

---

---

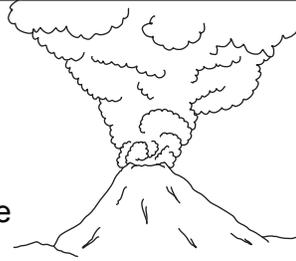

# The chemistry of LAVA

Oxygen and silicon are the most abundant elements in lava.

They combine to form silica, and the amount of silica determines what type of lava you have!

Lots of silica produces pale rocks like rhyolite. When melted, this type of lava is super thick and tends to be explosive, like the eruption of Mount St Helens.

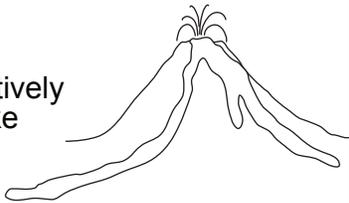

Low silica makes dark basalt rock and is relatively runny when melted, like the slowly oozing pahoehoe lava in Hawai'i.

HIGH SILICA

VS

LOW SILICA

## How hot is lava?

It all depends on the type of rock and what minerals it contains. Liquid rock (usually called lava) can be as cool as 700 °C and as hot as 1,200 °C. *That's 1300 - 2200° Fahrenheit!*

Your notes: \_\_\_\_\_

---

---

---

---

---

---

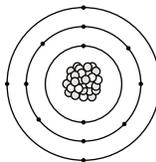

---

---

## Silicon

Element

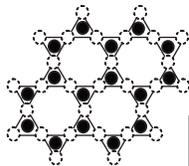

14 PROTONS  
14 NEUTRONS  
14 ELECTRONS

The second most abundant element on Earth after oxygen. Very rarely found in pure form, it loves to bond with oxygen. Widely used in electronics, especially computer chips.

## Silica

Compound

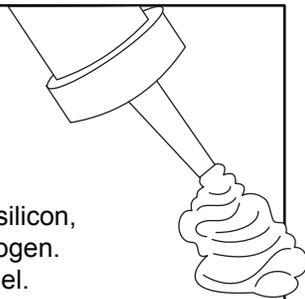

● SILICON  
○ OXYGEN

A compound of silicon and oxygen, most often a crystal of SiO<sub>2</sub>. Quartz is silica. The mineral is also found in sand, glass, and many other rocks.

## Silicone

Compound

A polymer (long chain) of silicon, oxygen, carbon, and hydrogen. Can be a solid, liquid, or gel.

## YOUR DOODLE SPACE

Draw your favorite moment from class or write a cool fact!

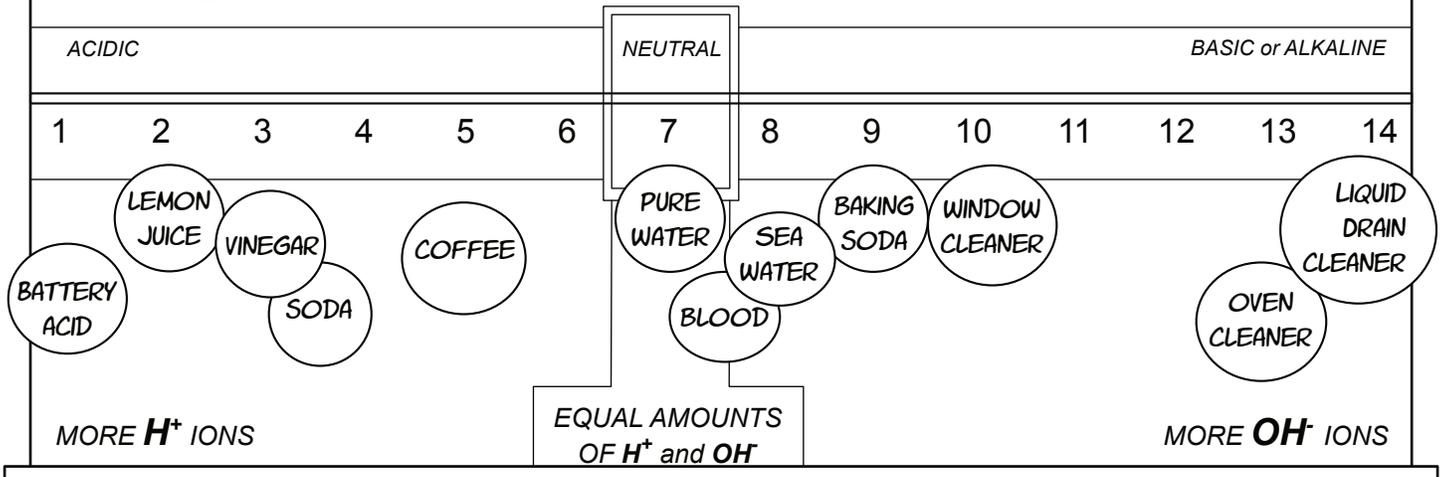

# ACIDS & BASES

FILL IN THE BLANKS  
USING THESE WORDS:

basic OH<sup>-</sup>  
pure  
acidic  
H<sup>+</sup> molecules  
hydrogen  
water

pH stands for "potential of \_\_\_\_\_" or "power of hydrogen." It is a scale used to measure how \_\_\_\_\_ or basic a solution is. At room temperature, \_\_\_\_\_ is neutral with a pH of 7. At neutral pH, the amount of hydrogen ions ( H<sup>+</sup> ) equals the number of hydroxide ions ( OH<sup>-</sup> ). In an acidic solution, there are more \_\_\_\_\_ ions than OH<sup>-</sup> ions. In a \_\_\_\_\_ solution, there are more \_\_\_\_\_ ions than H<sup>+</sup> ions.

# Why do we CHLORINATE SWIMMING POOLS?

HYPOCHLORITE AND HYPOCHLOROUS ACID ARE THE DISINFECTANTS THAT ELIMINATE HARMFUL BACTERIA, ALGAE, AND FUNGAL DISEASES FROM A SWIMMING POOL.

- CARBON
- OXYGEN
- HYDROGEN
- CHLORINE
- NITROGEN
- CALCIUM

The chemistry of swimming pools is fascinating! To keep a pool safe for people but inhospitable to bacteria and algae, the pH, salts, water hardness, and chlorine levels have to be just right.

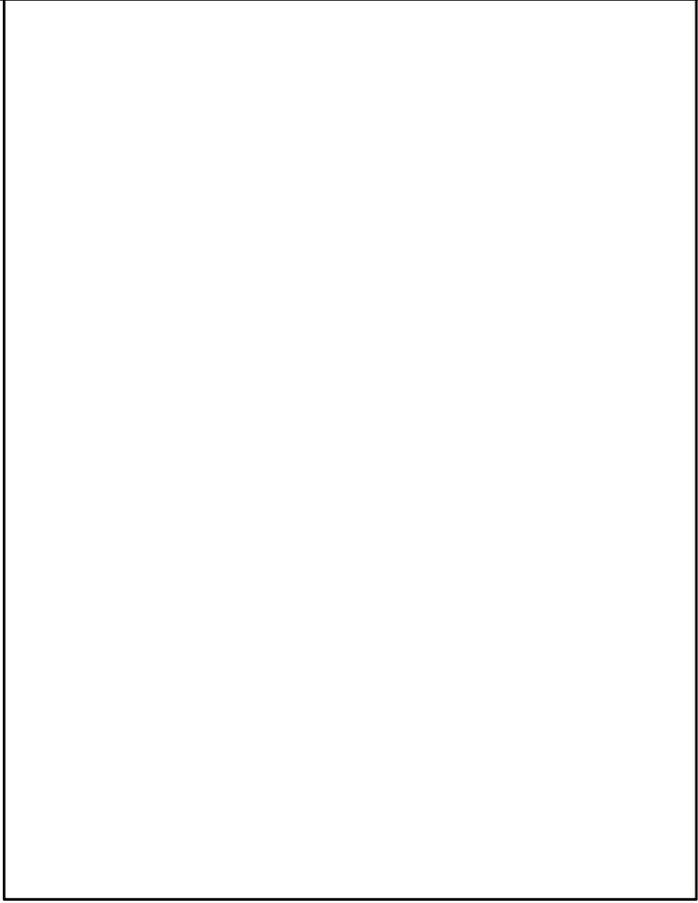

As UV light shines down, water evaporates, and people swim in the water, chemical reactions happen and everything changes! You don't need a degree in chemistry to keep your pool healthy – but you do need to check its chemicals frequently to maintain the right balance!

NEVER PEE IN A POOL! URINE CONTAINS URIC ACID. THE NITROGEN IN URIC ACID REACTS WITH CHLORINE TO FORM TRICHLORAMINE AND CYANOGEN CHLORIDE, BOTH OF WHICH ARE POISONOUS AND HARMFUL TO YOUR HEALTH.

# Hands-on Activity

## FRANKENSEEDS!

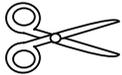

### MATERIALS:

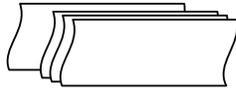

EGG CARTON

ZIPLOCK BAGS

SCISSORS OR KNIFE TO CUT THE EGG CARTON

PAPER TOWELS

AT LEAST 6 TYPES OF SEEDS FROM YOUR KITCHEN

EMPTY BREAD OR PRODUCE BAG

WATER

Choose six types of seeds from your kitchen and make predictions about which ones will sprout and which ones will not. If you expect that they will sprout, draw pictures of what you expect your plants to look like. Will they have two small round leaves or will they look more like a blade of grass? Will the seed split when it germinates? What shape will the leaves have?

- 1 Cut your egg carton in half so that you have two containers, each with six pockets.
- 2 Moisten two paper towels with water. Place a wet paper towel along the inside of each of the egg carton halves. Then put your seeds in the cartons. Arrange the cartons to be as identical as possible with three types of each seed in each pocket.
- 3 Next get two more paper towels wet and place them inside two ziplock bags. Place three of each of your seeds on these paper towels as well.
- 4 Cover the egg cartons with empty produce bags or bread bags to ensure that they stay moist. Place one in the fridge and one by a window.
- 5 Tape one of your plastic bags to a window so that it gets some sunlight. Place the other plastic bag in a different location. You can choose to put it in the fridge (cold and dark) or to place it somewhere that has less light.
- 6 Check on your seeds everyday and record your observations. Make sure the paper towels do not dry out (add water as needed) and that the seeds do not get too wet (they should not be covered in water).
- 7 After one week, move the seeds that were in the fridge to a location with light and warmer temperatures. After 2 weeks compare your predictions to the results that you observed.

### Is it a seed?

yes no

# SUGARS

## YOUR DOODLE SPACE

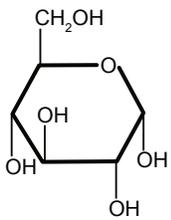

Draw your favorite moment from class or write a cool fact!

TWO WAYS OF DRAWING THE SAME MOLECULE!

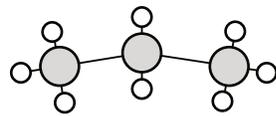

=

People got tired of drawing out all the hydrogens and carbons, so they came up with a great idea: stick figure carbon chains!  $\triangle$  = 3 carbons & 8 hydrogens. Drawn out with circles for atoms, it would look like this:

● CARBON  
○ HYDROGEN

## HFCS EXPLAINED:

HFCS stands for High Fructose Corn Syrup, an artificial sweetener made by converting glucose to fructose. Why would people designing special chemical reactions to increase the amount of fructose in corn syrup? Because glucose doesn't taste very sweet! Pretty much all of the taste and sweetness of regular sugar (sucrose) comes from the fructose. Increasing the amount of fructose increases the sweetness.

Your notes: \_\_\_\_\_

SUGAR MOLECULES ARE RINGS OF CARBON.

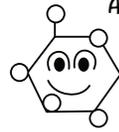

SOMETIMES THEY HAVE ONE RING, AND SOMETIMES THEY HAVE TWO!

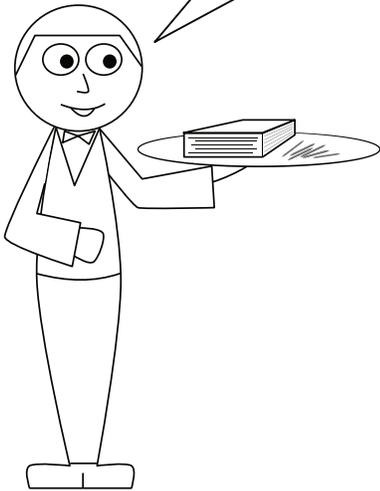

# Why can't we eat wood?

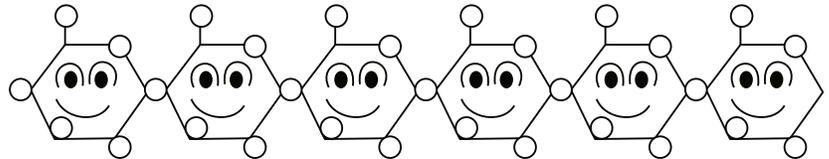

I'M GLUCOSE! AN ENERGETIC CIRCLE OF CARBON AND OXYGEN AND THE MAIN INGREDIENT IN BOTH STARCH AND CELLULOSE!

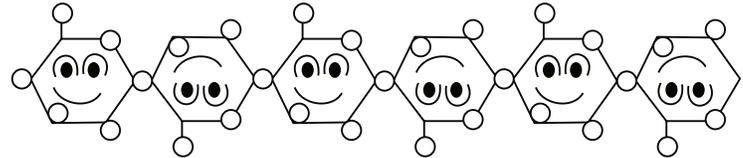

THIS NOVEL GOES VERY NICELY WITH A SIDE OF TOOTHPICKS.

Can you spot the difference between starch and cellulose?

String glucose together like this, and you get **starch**—A big ingredient in things like potatoes and corn and rice and wheat.

String glucose together like this, and you get **cellulose**—the main ingredient in things like leaves and straw and wood.

A termite can eat a piece of wood and get energy from it. A cow can eat grass and get energy from that. But if you eat wood or grass it's called *fiber*. Your body can't digest it and it passes straight on through. Have you ever wondered why? Why can you live for weeks on a diet of potatoes, but not newspapers or twigs?

Cellulose and starch are both polymers made of the same building unit: glucose. The difference between them is HOW the glucose molecules are linked together. In starch, all the molecules are facing the same way. We call this an alpha linkage. In cellulose, every other glucose is flipped upside down. We call this a beta linkage. When you eat starch, your body can break that alpha linkage apart so each of your cells can eat the glucose. But beta linkages are tricky. They can only be broken by bacteria and fungi. NOT A SINGLE ANIMAL can do it. So then how in the world do termites eat wood? How do horses cows, goats, and sheep eat grass? (Look at the next page to find out!)

Your notes: \_\_\_\_\_

---

---

---

---

---

---

## YOUR DOODLE SPACE

Draw your favorite moment from class or write a cool fact!

### The Termite

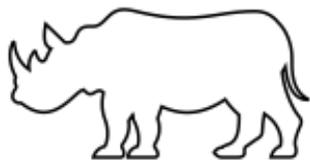

Termites have special bacteria living in their stomachs that digest cellulose for them, breaking it apart into glucose. Give a termite an antibiotic, and it would starve to death no matter how much wood it ate.

The termite can only digest wood with the help of its special "termite gut microbes."

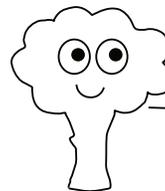

### The Herbivores

Herbivores also digest grass with the help of bacteria. Some herbivores (cows) have 4 stomachs to provide even better homes for those important little microbes. Others, like the camel and hippopotamus, have 3 stomachs. And horses have just 1, plus a long "water gut" that provides the perfect place for the bacteria to do their work.

CURIOUS WHICH FOODS HAVE THE MOST FIBER? THAT WOULD BE DARK GREEN VEGETABLES, LEGUMES, AND WHOLE GRAINS!

Your notes: \_\_\_\_\_

---

---

---

---

---

---

---

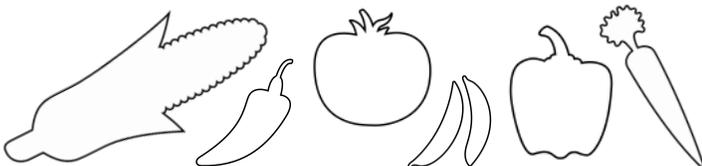

---

---

---

### Why fiber is important

We can't digest cellulose, but does that mean we don't want to eat it? Not so fast! If you were able to digest absolutely *everything* you ate, well, that would be a bit of a problem. How would you get rid of things your body didn't want, like extra cholesterol in your blood? If you have enough fiber, the fiber binds to the extra cholesterol and takes it out with the trash. If you don't have enough fiber, the cholesterol is reabsorbed into the bloodstream. Too much cholesterol can cause a heart attack. And that's just one of the many benefits of having enough fiber in your diet.

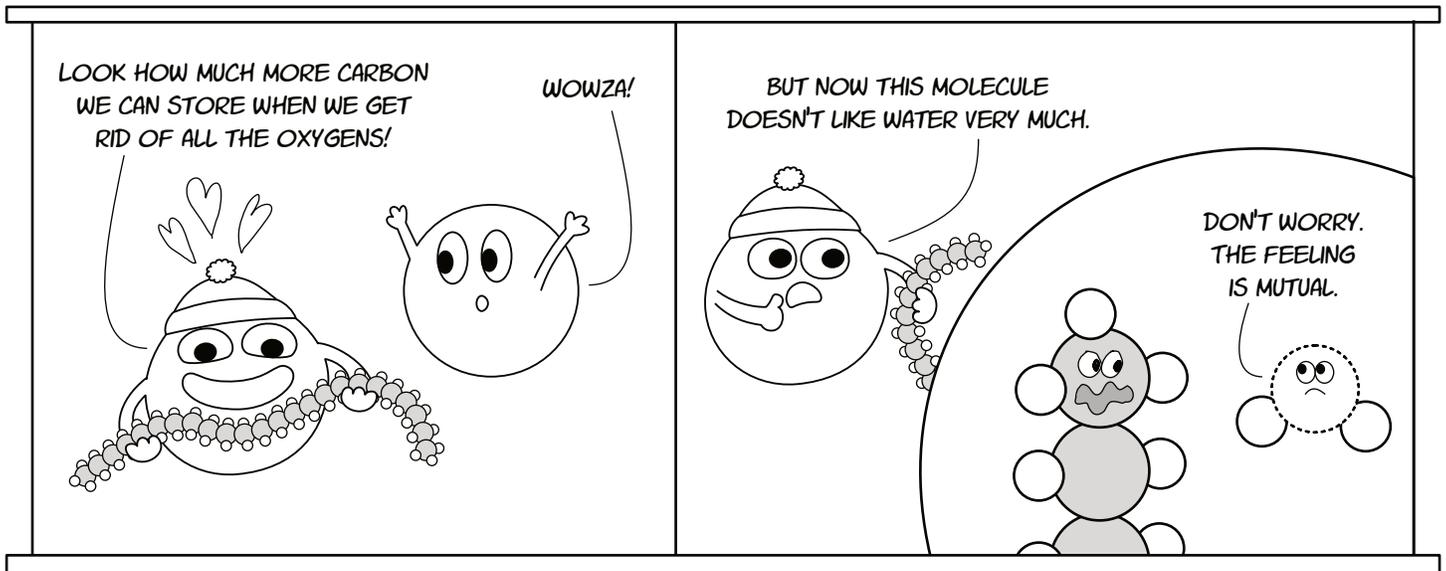

# LIPIDS AKA fat & oil

FILL IN THE BLANKS USING THESE WORDS:

oils      carbon      hydrogen  
fats      hydrophobic      determines

Lipids are fats and \_\_\_\_\_. Chemically, they are very long strands of carbon and \_\_\_\_\_. How long the strand is and what types of bonds it has (single or double) \_\_\_\_\_ what type of oil or fat it is. But all \_\_\_\_\_ and oils are mostly made of just two atoms: \_\_\_\_\_ and hydrogen. Because these long strands don't have any charged areas, they are \_\_\_\_\_ which means water fearing. This is why oil and water don't mix together!

## YOUR DOODLE SPACE

# PLANKTON

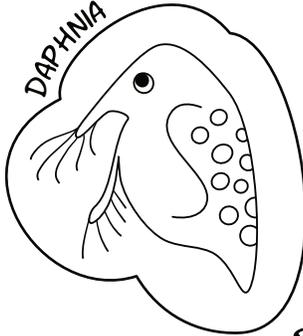

Small but mighty!

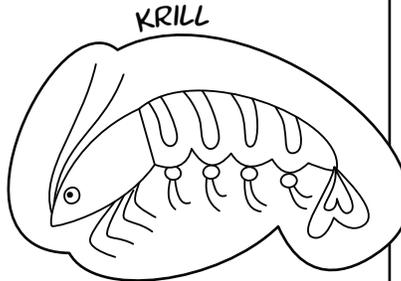

COPEPOD

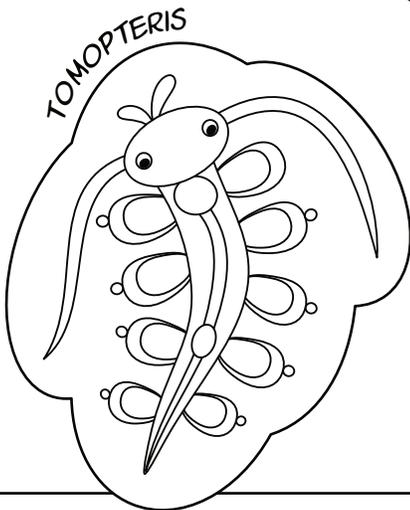

OSTRACOD

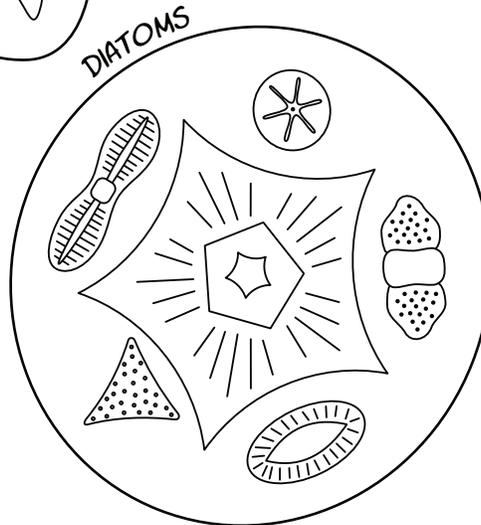

DAPHNIA

KRILL

TOMOPTERIS

DIATOMS

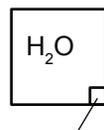

Plankton are the microscopic organisms floating in seawater or \_\_\_\_\_ water. They can be plants, animals, viruses, or fungi! \_\_\_\_\_, like diatoms, are photosynthetic. \_\_\_\_\_, like copepods or krill, are small animals that eat other plankton. All animals on Earth depend on plankton because they produce most of the world's \_\_\_\_\_ and absorb large amounts of \_\_\_\_\_.

FILL IN THE BLANKS ABOVE USING THESE WORDS:

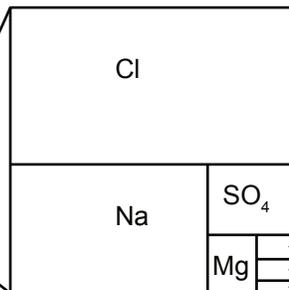

zooplankton phytoplankton  
oxygen fresh CO<sub>2</sub>

# SEAWATER

96.5% water  
3.5% dissolved salts

dissolved salts

Ca  
K  
everything else

The salts are mostly sodium chloride (~85%) but there's a decent amount of sulfate (7%), magnesium (4%), calcium (1.2%) and potassium (1.1%) too.

Your notes: \_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_

# Hands-on Activity

## Plant propagation

### MATERIALS:

- A TUBER (SUCH AS A POTATO)
- A ROOT VEGETABLE (CARROT)
- A PINEAPPLE
- CUPS
- TOOTHPICKS
- WATER

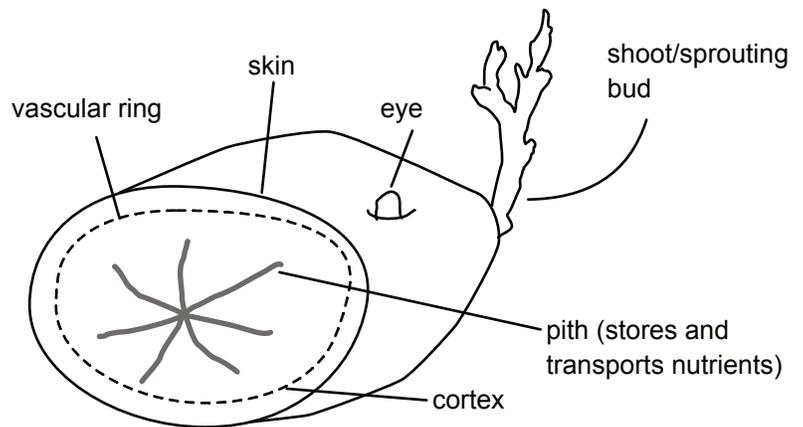

I CAN TURN INTO ANYTHING!

A leaf is very different than a root, and those differences come from the cells and how they behave. Not all plant cells can grow into roots or leaves or a new plant. But certain cells called meristems can! Try regrowing plants from foods in the kitchen to learn more about these amazing meristems and different types of plants.

## TUBERS

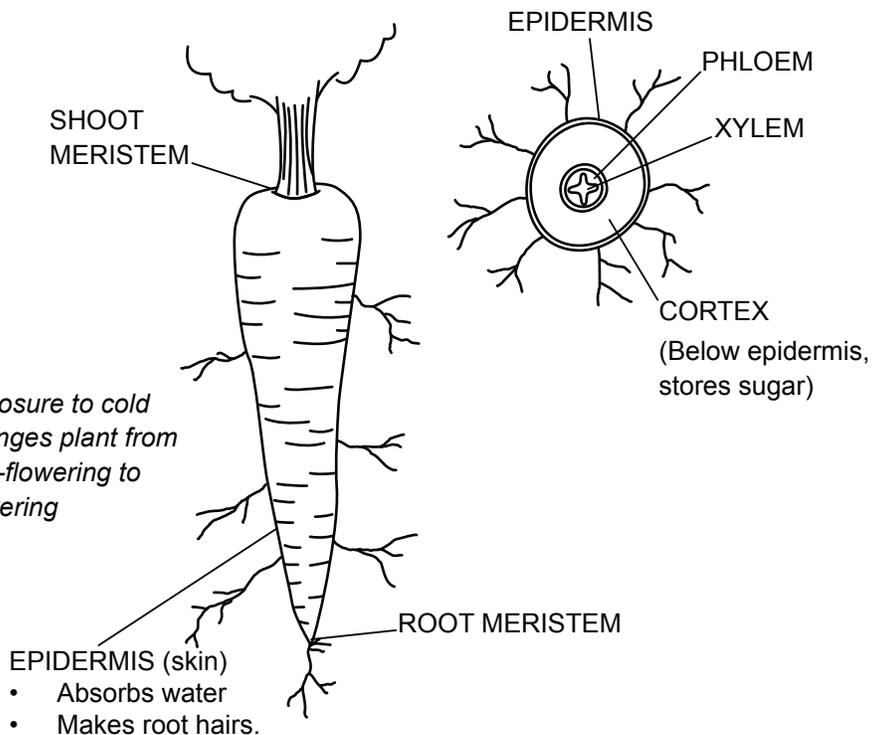

In a tuber like a potato, sweet potato, turmeric, or ginger, there are small "eyes" or nodes where a new shoot and root can grow. If you cut a potato or other tuber and place toothpicks in it so that it is half submerged in water, a shoot and roots will grow from the node.

## ROOTS

Root vegetables like a beets, carrots, turnips, rutabagas, parsnips, or onions can regrow from the top of the vegetable. Select a vegetable with some green at the top. Place the top in a cup that is partially filled with water. Use toothpicks to suspend it so that the bottom part is wet but the top is exposed to air. The plant will regrow from the top but it won't grow a new root vegetable -- only the leaves and potentially flowers and seeds.

*Exposure to cold changes plant from non-flowering to flowering*

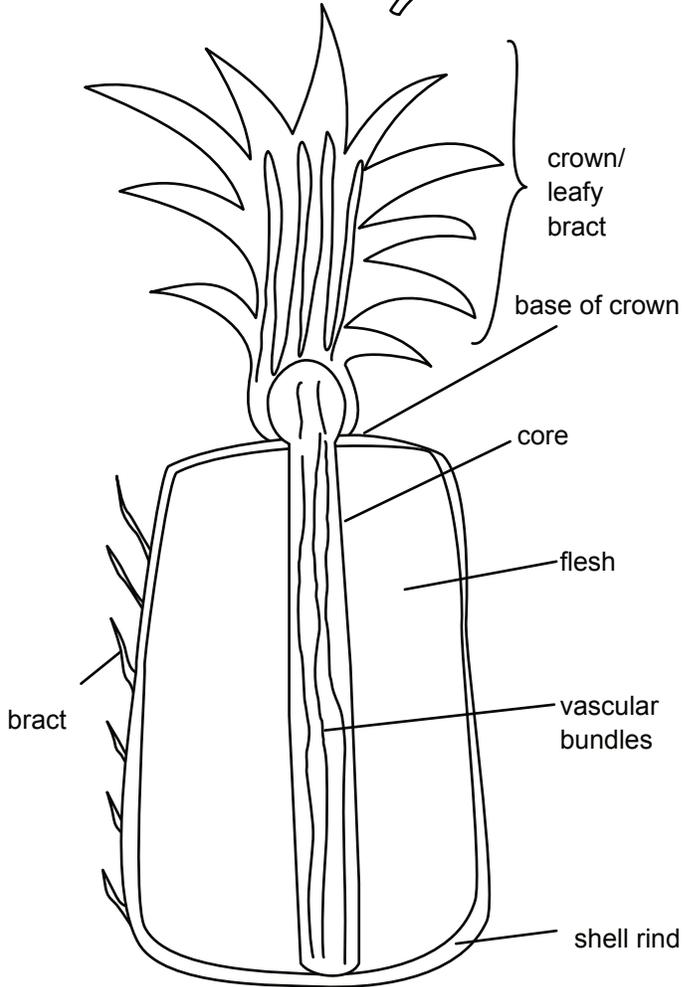

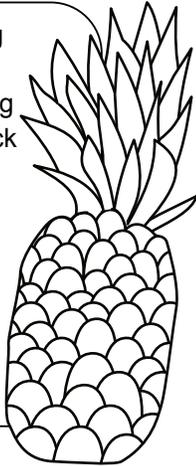

# Hands-on Activity

Plant propagation continued...

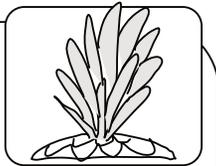

## PINEAPPLES!

Pineapples are a very interesting fruit because they have a full miniature pineapple plant growing on top of the fruit! If you peel back the leaves from the top of a pineapple, you will see tiny little rootlets. Place this top of the pineapple into a cup half full of water. Soon roots will emerge. Congrats! Your new pineapple plant is growing.

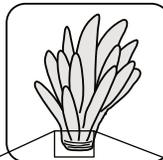

A pineapple is a "sorosus." That's greek for heap. It's a cluster of berries that all grew together! Each bract is one fruit.

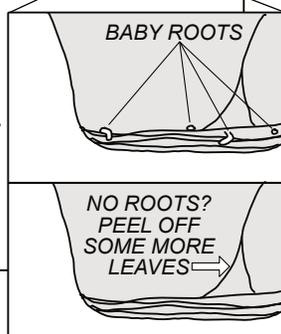

**1** Cut off the pineapple top.

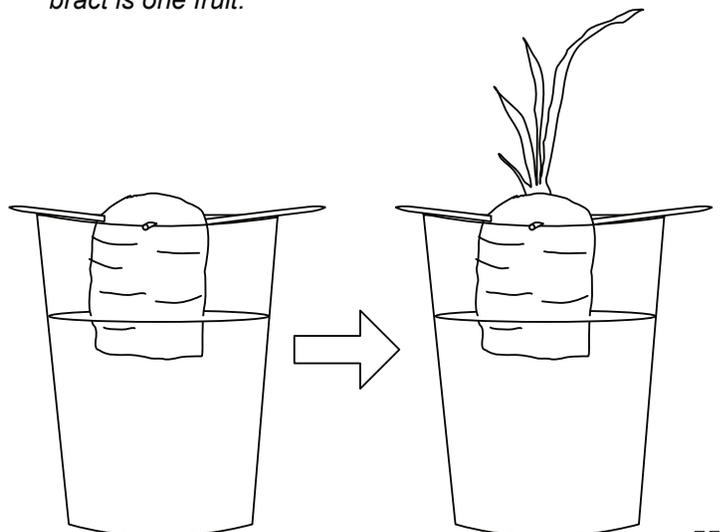

**2** Pull off fruit and first two layer of leaves from the base.

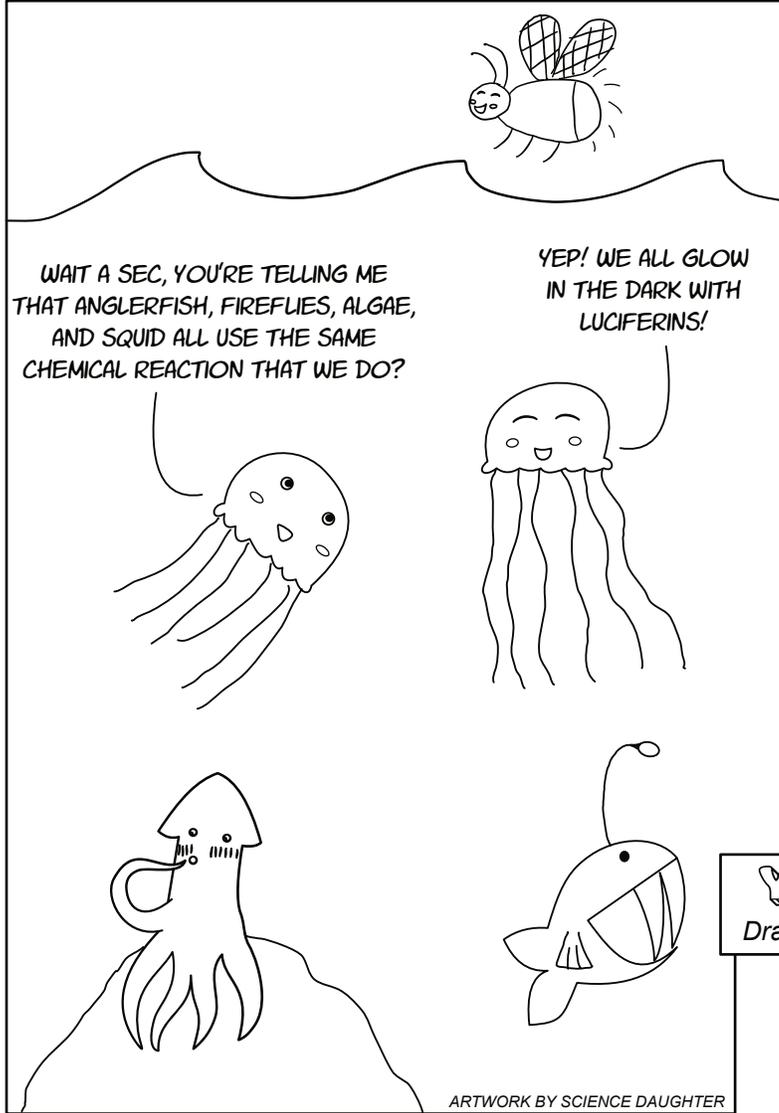

**3** Look closely. Do you see tiny little nubs of roots? Yes? Put your pineapple in a cup with some water. No? Keep removing leaves until you find the small nubs of roots.

You can also try: an avocado pit, basil leaves, the base of a bok choy, cabbage leaves, celery base, cilantro stems, garlic, green onions, mushroom stocks, onion base, or romaine lettuce base.

# BIOLUMINESCENCE

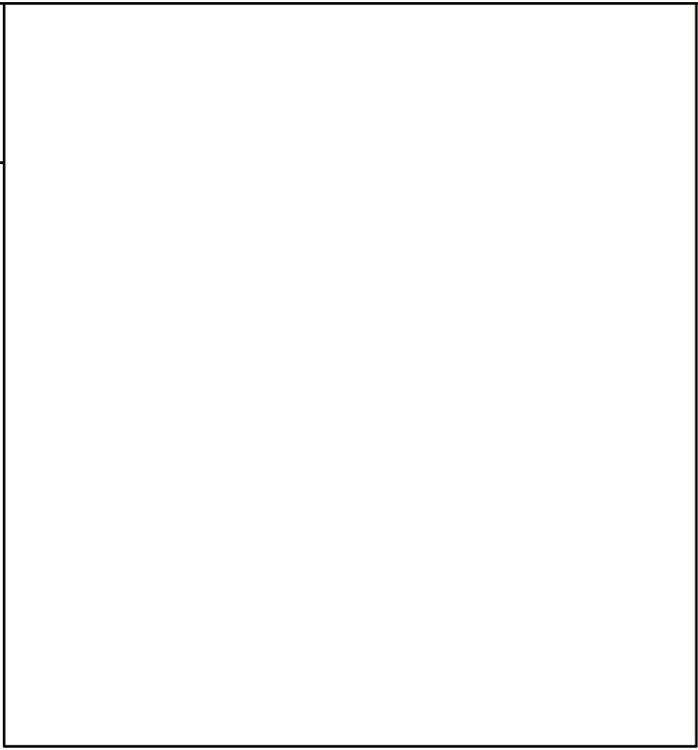

When living animals make light it is called \_\_\_\_\_. Certain types of insects, fish, invertebrates, and algae can create \_\_\_\_\_ using a special \_\_\_\_\_ reaction. While there are several different types of chemicals are used, the main idea is that \_\_\_\_\_ provides energy for a chemical reaction that creates light. The \_\_\_\_\_ can control when the reaction starts and stops, creating \_\_\_\_\_ of light to communicate, lure in prey, or escape from predators.

FILL IN THE BLANKS ABOVE USING THESE WORDS:

- |          |        |                 |
|----------|--------|-----------------|
| light    | animal | bioluminescence |

# From CELLS to COLONIES

THE BRAIN SAW A SPIDER, AND NOW ADRENALINE IS HERE!

ON IT!

HOLD ON, SHOULDN'T SOMEONE TELL THE HEART CELLS NOT TO PANIC? THE LAST TIME WE SAW A SPIDER NOTHING BAD HAPPENED.

I'LL TELL THE BLOOD CELLS TO MOVE FASTER!

TOO LATE! ADRENALINE ALREADY GOT HERE AND WE'RE FREAKING OUT!

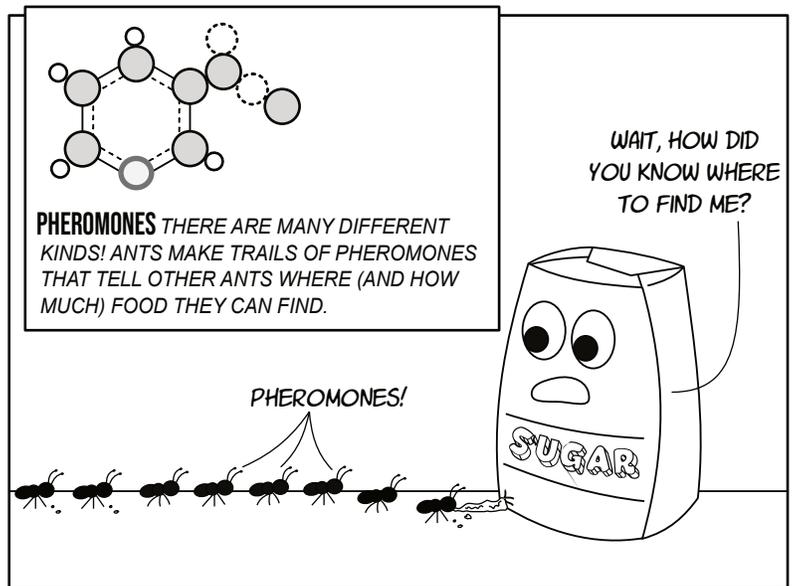

HEART MUSCLE CELLS

**ADRENALINE** ALSO KNOWN AS EPINEPHRINE. IT'S THE MAIN MOLECULE BEHIND "FIGHT OR FLIGHT." A LITTLE BIT GOES A LONG WAY!

- CARBON
- OXYGEN
- NITROGEN
- HYDROGEN

**CHEMISTRY IS EVERYWHERE!**

How does a nerve cell learn to send signals, or a blood cell to carry oxygen? How does one ant tell the rest of the colony where to find food? The answer to both questions comes down to chemistry! Chemical reactions power the life of the cell, and control how it communicates with other cells. And it's not just cells that communicate with chemicals - insect colonies do too!

WAIT, HOW DID YOU KNOW WHERE TO FIND ME?

PHEROMONES!

**PHEROMONES** THERE ARE MANY DIFFERENT KINDS! ANTS MAKE TRAILS OF PHEROMONES THAT TELL OTHER ANTS WHERE (AND HOW MUCH) FOOD THEY CAN FIND.

Your notes: \_\_\_\_\_

\_\_\_\_\_

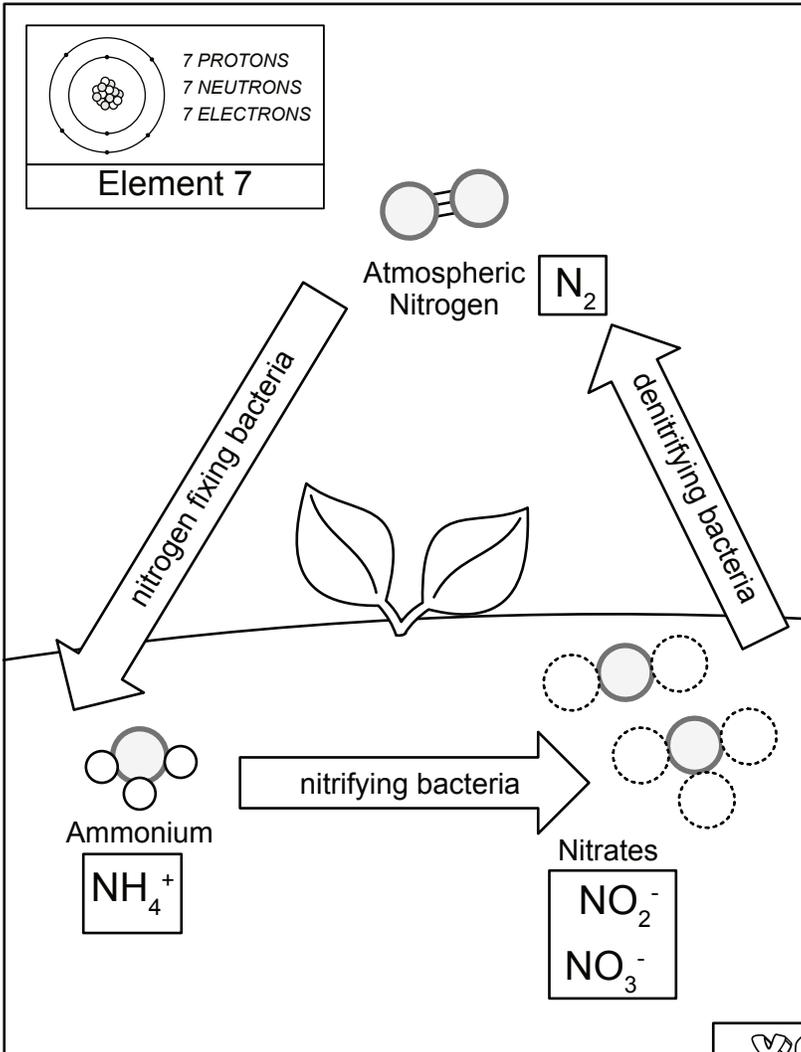

\_\_\_\_\_

\_\_\_\_\_

\_\_\_\_\_

# NITROGEN

## Essential nutrient & most of our air

Nitrogen is an essential element used to make \_\_\_\_\_ and DNA. Every \_\_\_\_\_ and plant needs it, and 78% of Earth's \_\_\_\_\_ is nitrogen. So you might think that it would be easy to get, but the nitrogen in the air is N<sub>2</sub>. It's two atoms bound with a very strong \_\_\_\_\_ bond and that bond is very hard to break! No animals can do it. No plants can do it. Only \_\_\_\_\_ can change atmospheric nitrogen into a form that \_\_\_\_\_ and animals can use. We call this "fixing" nitrogen.

FILL IN THE BLANKS ABOVE USING THESE WORDS:

- |          |          |            |
|----------|----------|------------|
| bacteria | proteins | animal     |
| triple   | plants   | atmosphere |

1. POOP GOES INTO THE CHAMBER POT.  
LOOK OUT BELOW!

2. CHAMBER POT IS EMPTIED INTO STREET OR CESSPIT.  
WOW, WE'RE EVERYWHERE!

3. STREET AND BRICK SEWERS EMPTY INTO THE RIVER THAMES  
RIGHT!?!

**THE WATER TREATMENT PLANT**

1. SEPARATE THE LIQUIDS FROM THE SOLIDS

2. AERATE AND TREAT WITH SPECIAL BACTERIA

3. FILTER AND DISINFECT

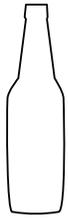

4. THE EFFLUENT (NOW CLEAN WATER AGAIN) IS RELEASED BACK INTO THE WATER SYSTEM (RIVER OR OCEAN)

SOLIDS GO TO LANDFILL OR BECOME PROCESSED INTO FERTILIZER

# Hands-on Activity

## DIY water filter

### MATERIALS:

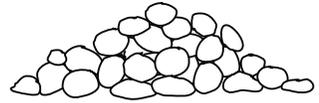

A PLASTIC BOTTLE  
(16 OR 12 OUNCES)

COTTON BALLS OR A PIECE  
OF COTTON FABRIC

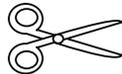

WATER

1/2 CUP GRAVEL

2 COFFEE  
FILTERS

SCISSORS OR KNIFE TO  
CUT THE PLASTIC BOTTLE

1/4 CUP ACTIVATED CHARCOAL

1/2 CUP SAND

### INSTRUCTIONS:

**1** Carefully use scissors or knife to cut off the bottom of the water bottle to create a tall funnel.

**2** Trim one of the coffee filters into four smaller circles.

**3** Place one or two cotton balls on top of two of the coffee filter circles. Carefully place them in the neck of the water bottle. If they flip and turn sideways simply turn the bottle upside down and shake them back out and then try again. It may help to use a chopstick or wooden skewer or straw.

**4** Once you have your coffee filter circles and cotton balls in place, put the remaining coffee filter circles on top to make a "coffee filter cotton ball sandwich." This is the lowest layer of filtration.

**5** Next, carefully pour 1/4 cup of activated charcoal onto a coffee filter and lower it into the bottle. Then fold the coffee filter over the top of the charcoal to completely enclose it.

Run a little bit of water through the filter to help the two lower layers compress and make sure that they are pressed against the sides of the bottle.

Next add 1/2 cup of sand, then add the final layer of 1/2 cup of gravel.

**6** Experiment by running different liquids through your filter. Start with relatively clean water such as the leftover water from cooking vegetables. If you run it through your filter, does it still smell like vegetables or have color to it? Or did the filter clean the water?

**7** Next, add some food coloring to your water or go outside and get some mud. See how your filter does cleaning that water.

Your observations: \_\_\_\_\_

---

---

---

---

---

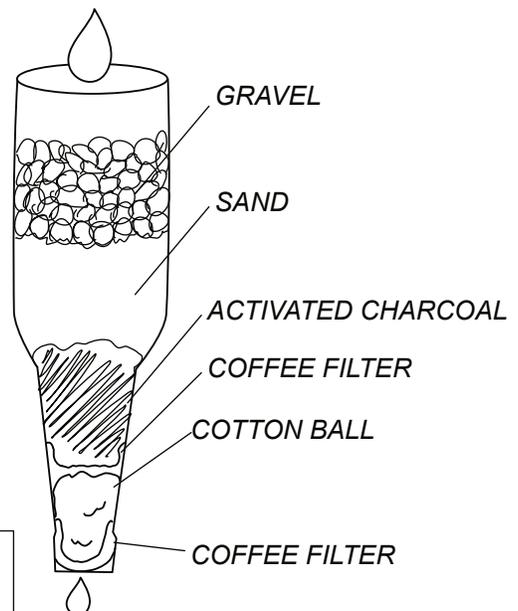

---

---

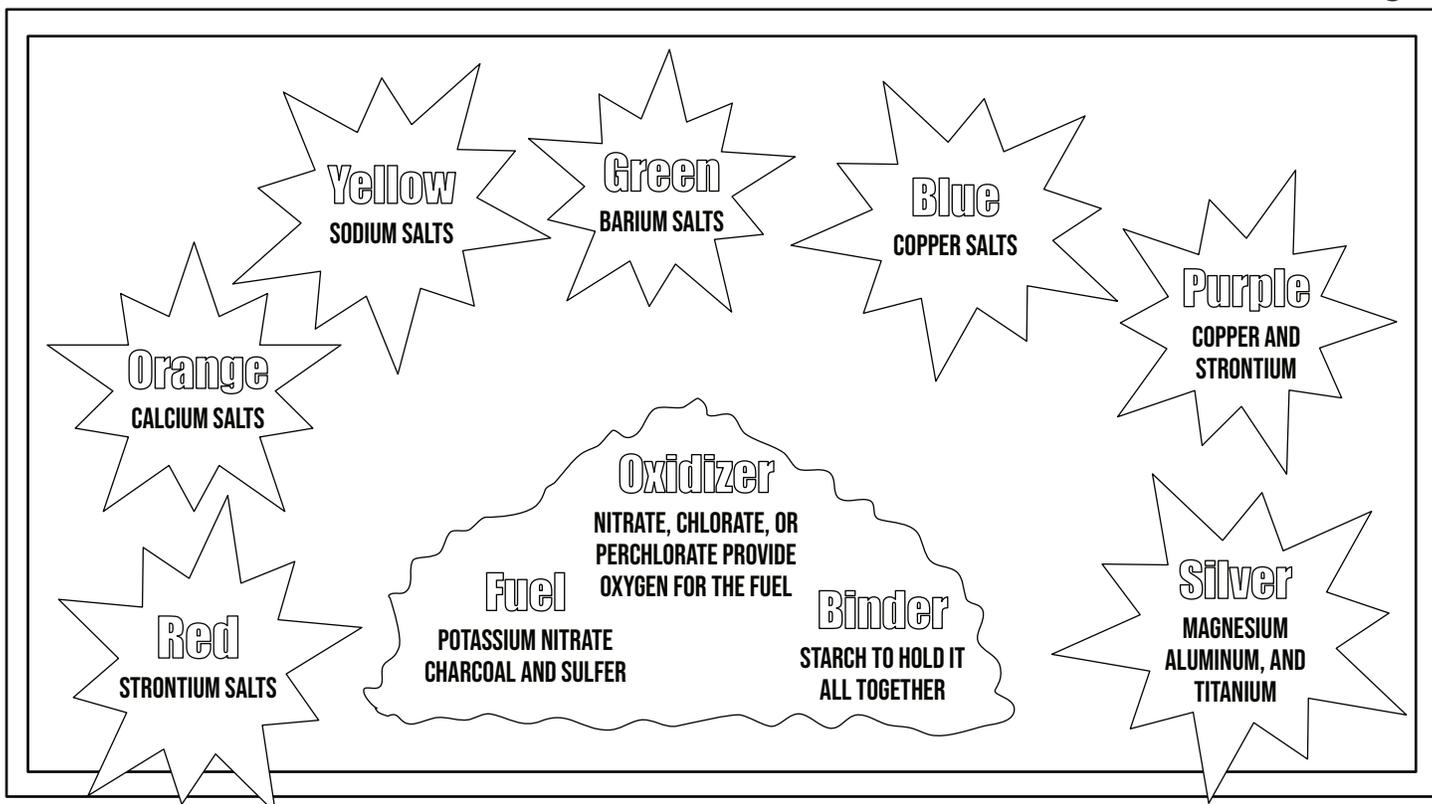

---

**Warning!** Only drink water that you know is safe to drink! While this filter is similar to modern filtration systems, it is small enough that contaminants can overwhelm it and "sneak" through.

# FIREWORKS and lab safety

FILL IN THE BLANKS USING THESE WORDS:

safety      chemical      reactions  
pressure      safe

Fireworks are controlled \_\_\_\_\_. These explosive devices delight us with their bright colors on holidays around the world, and they're also a good reminder of the importance of \_\_\_\_\_ precautions. Can chemistry be a lot of fun? Absolutely. Can a little knowledge be a dangerous thing? Sometimes! Make sure you think ahead about what might happen during a reaction. If your future chemistry experiment will produce a gas, be extra careful because \_\_\_\_\_ might build up. Always wear safety glasses, and make sure to clean up after yourself when your experiments are done! Keeping your laboratory space clean and organized isn't just good manners. It keeps you and your equipments \_\_\_\_\_.

# SECRET CODES

for your eyes only!

Hello Special Agent. Something very valuable has been stolen from the vault of the Bank of Big Bucks! We need your help to decode information about the object, location, and sneaky spy so that it can be retrieved.

Here is a binary code that uses the number zero to represent a white square, and the number one to represent a black square. Fill in the grid accordingly to create an image of the stolen object!

**THE BINARY CODE:**

Row one: 0000000000000000  
 Row two: 00011111111111000  
 Row three: 00100000100000100  
 Row four: 01010001010001010  
 Row five: 10001010001010001  
 Row six: 01111111111111110  
 Row seven: 00101000000010100  
 Row eight: 0001000000001000  
 Row nine: 00001000000010000  
 Row ten: 00000100000100000  
 Row eleven: 00000010001000000  
 Row twelve: 00000001010000000  
 Row thirteen: 00000000100000000  
 Row fourteen: 00000000000000000

**HINT:**  
 This object is 99.95% composed of  $\frac{3}{18}$   $\frac{1}{2}$   $\frac{15}{14}$ .  
 The name is written in alphabet number code!  
 1=A, 2=B, etc...

Row 1:																				
Row 2:																				
Row 3:																				
Row 4:																				
Row 5:																				
Row 6:																				
Row 7:																				
Row 8:																				
Row 9:																				
Row 10:																				
Row 11:																				
Row 12:																				
Row 13:																				
Row 14:																				

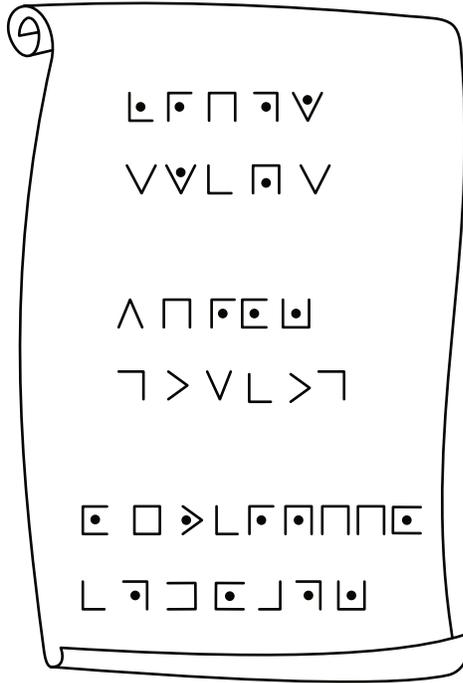

Wonderful! Now that you know what you are looking for, you need to figure out where it is being hidden. The location has been encoded in "alphabet grid" format. Take a look at the grids below. The first letters in each space are represented by the line around it. The second letters get an additional dot included. For example: The "I" looks like a square, and "J" looks like a square with a dot in it. "S" looks like a V, and "T" looks like a V with a dot in it.

I = □	J = ◻
S = √	T = √◻

AB	CD	EF
GH	IJ	KL
MN	OP	QR

	ST	
UV		YZ
	WX	

The object is under the:

\_\_\_\_\_

\_\_\_\_\_

of the:

\_\_\_\_\_

\_\_\_\_\_

Located in:

\_\_\_\_\_

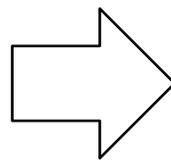

\_\_\_\_\_

Last, find the spy who stole the object from the vault. Their description has been encrypted using reverse alphabet coding. We have started the cypher for you by including the original alphabet. To complete the cypher start at the end with letter Z, and write an A under it. Next write a B under the letter Y, then a C under the letter X. Continue this pattern until you finish by writing a Z under the letter A. Once you are done you can decode!

Ex. XZG = CAT, SZKKB = HAPPY

A	B	C	D	E	F	G	H	I	J	K	L	M
N	O	P	Q	R	S	T	U	V	W	X	Y	Z

**GSV HKB:**  
 Mznv: ZOVC HNRGS  
 Atv: URUGB  
 Vbvh: TIVVM  
 Szri: IVW  
 Gz+ll: HZIP

**THE SPY:**

Name: \_\_\_\_\_

Age: \_\_\_\_\_

Eyes: \_\_\_\_\_

Hair: \_\_\_\_\_

Tattoo: \_\_\_\_\_
